9007. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-01 18:27:53 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 9007

Enter your vote today! A new poll has been created for the
orion565 group:

Which LCD Display Color do you use on the Orion II?

o Color 1
o Color 2
o Color 3
o Color 4
o Color 5
o Color 6
o Color 7
o Color 8

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13164487

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

9008. Re: [orion565] Re: Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Master Reset restored normal audio. In the future, I'll stay away from "Taps".

73,
Barry N1EU

It does mean that the reduced fatigue due to smoother audio that results from a less than brickwall filter is not available though. Being able to adjust the shape of the filter as well as the bandwidth seems a most useful feature.

9010. Re: [orion565] Re: Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-02 11:39:28 UTC
From: Barry N1EU
Topic: 8982 Message: 9010

My Orion worked fine at 32 taps from 2000-4000hz selectivity. It was only
when I reduced BW to 100hz that it went haywire. Why anyone would want to
use 32 taps at 100hz is beyond me.

Or maybe I'm missing something . . .

73,
Barry N1EU

9011. RE: [orion565] Re: Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-02 11:45:17 UTC
From: Martin Sole
Topic: 8982 Message: 9011

I agree, that combination would be a rather pointless combination, a bit like 250Hz roofing filter with 6kHz wide digital bandwidth, but that doesn't do strange things. If there were a limit on how far you could reduce the bandwidth at the gentler sloped filter settings that would be ok, the fact there is a combination of control settings that screws things up is not, at least to me.

Martin, HS0ZED

My Orion worked fine at 32 taps from 2000-4000hz selectivity. It was only when I reduced BW to 100hz that it went haywire. Why anyone would want to use 32 taps at 100hz is beyond me.

Or maybe I'm missing something . . .

73,
Barry N1EU

9012. Re: [orion565] Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-02 12:47:46 UTC
From: Jerry Rogers
Topic: 8982 Message: 9012

I thought the taps was a way to adjust the "filter skirt". Just like on the Icom selection "Soft or Sharp". Causes the radio to take-on that older radio mellow sound.

As for using it at tap 32 and 100hz, I guess if you want that wider skirt sound it's okay.

Jerry, ki4ps

[Non-text portions of this message have been removed]

9015. Re: Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-02 14:07:07 UTC
From: kc2qma
Topic: 8982 Message: 9015

Jerry you hit the nail in the head!

It lowers the "Q" factor or adjusts the sharpness of the skirts. And of course I do not use the Orion with the taps at 32 and the BW at 100Hz but I do sometimes lower the taps to 32 and listen to AM and SSB signals using typical bandwidth settings. It does make the Orion sound more like a vintage boat anchor type receiver or at least makes the sound softer.

This is just to show that there is a way to cause the Orion II to have distorted audio by simply making a certain combination of adjustments. In theory the end user should not be able to cause a device to fail do to making any combination of adjustments.(That's know as a BUG)

Pardon the emphasis, but WHY ARE YOU REDUCING THE BANDWIDTH DOWN TO 100HZ
IF YOU ARE LISTENING TO PHONE?

In a perfect world . . . . .

Yes, you HAVE found a bug. But considering the endless issues for Ten-Tec engineering to tackle with limited resources, I'd put this near the bottom of the list. If a certain combination of adjustments causes a device to fail, then avoid those combination of adjustments, which in this case should be EASY to do (i.e., 100hz BW and phone operation).

73,
Barry N1EU

Hey everybody look we have an antagonist! Hello Barry.

Clearly you are not reading what I said.

YES: this is a bug.

NO: it is not a priority.

YES: You if you don't make this combination of adjustments it won't cause this failure.

NO: I do not use the Orion at 100Hz Bandwidth when listing to anything.

THIS WAS JUST A TEST TO SEE IF OTHERS COULD CAUSE THE SAME RESULTS. THAT'S ALL!

IF this is a problem for YOU then just use YOUR Orion The way you want and don't worry about the topic.

Thank you for the other people who GET IT!
73/KC2QMA

Topic: 8982 Message: 9019

Two years ago at Orlando Hamcation, John Henry wrote this bug on a slip of paper. Perhaps he misplaced it, or judged it to be unworthy of further consideration.

On 160m CW, it helps copy of weak CW sigs in the noise to reduce group delay and round the knees by lowering the TAPs from 199 to 130-180, depending on the received noise level.

In my experience, any taps selection other than 199 renders the filter unstable. Adjusting the BW knob causes the filter to scramble after a few seconds, producing strange sounds. In some instances, the filter scrambles without doing anything. I go to menu and set taps just up or down, and the filter resets.

It would be nice to have this bug fixed, as many trips into the menu to reset the filter could be avoided.

Of interest is one filter scramble incident popped a weak sig out of the noise. To me this indicates that advanced control of this filter might produce a higher level of filter usefulness.

>
> Jerry you hit the nail in the head!
>
> It lowers the "Q" factor or adjusts the sharpness of the skirts. And of course I do not use the Orion with the taps at 32 and the BW at 100Hz but I do sometimes lower the taps to 32 and listen to AM and SSB signals using typical bandwidth settings. It does make the Orion sound more like a vintage boat anchor type receiver or at least makes the sound softer.

Before you label something "a bug" I think you should check with the designer to see what the design parameters were. There may really be a bug but maybe what you have "discovered" is something that was known and simply deemed to not be of any interest. Or, it may be so far outside the range of intended use that it was never considered in any respect, bug or otherwise.

Hey everybody look we have an antagonist! Hello Barry.

Clearly you are not reading what I said.

YES: this is a bug.

NO: it is not a priority.

YES: You if you don't make this combination of adjustments it won't cause this failure.

NO: I do not use the Orion at 100Hz Bandwidth when listing to anything.

THIS WAS JUST A TEST TO SEE IF OTHERS COULD CAUSE THE SAME RESULTS. THAT'S ALL!

IF this is a problem for YOU then just use YOUR Orion The way you want and don't worry about the topic.

Thank you for the other people who GET IT!
73/KC2QMA

Wes, you are correct this bug is caused by creating settings that are outside of normal operating practice. However it does appear to be repeatable by other users. This is not a big problem because almost no user will ever need or even want to set their rig this way but it does show a small bug in the software. And that is all that I was trying to find out.

I repeat, this is NOT a priority at all, and I don't expect Ten Tec to look at this any time soon.

But I will say that the fact that Ten Tec put the "DSP filter length" in the menu was so that the user could adjust the filter "Q" to his or her liking for their particular situation and that is just another thing that makes the Orion really special compared to other rigs.

Like I said before, I like to sometimes lower the "DSP filter length" when for example working AM with BW at 9000. It does soften the skirts making for a smoother sound.

Yes, this is created by setting values outside of where they should be, however, the software should either not allow this or recover properly when settings get back to normal. I do remember writing this down on a paper at one of the hamventions a year ago, and have added it to things to look at when time permits. For now, I hate to say, "if it breaks it don't do it". I hate answers like that, but let's continue on and when we do feel it the right time to fix it, we will.
There are a LOT of oars in the water right now. Gotta prioritize them and depending upon impact to use or if a work around exists, etc., they may get done at a later date.

Thanks for all the inputs, I know sometimes it seems like TenTec isn't listening, that isn't the case, we are 120% utilized at bringing great new things to market, improving existing production products, and finally improving existing products that have been out of production for xx years or more. Not many do that nowadays.

Take care, and 73,
John Henry, KI4JPL

Thank you John Henery and the TT team are doing a great job creating and improving your products.

I BTW I just LOVE the new meter update it works great, And a few of us even think the Orion audio sounds even better than before.

This DSP Filter thing was just a test to see if others had the same results. And since this is just NOT a big problem I would put it way down the list. I think we would all rather TT put their efforts into new products and really cool updates and new features for the Orion.

Once again, Thank you for all the hard work and dedication you and the TT team do for us users.
I AM A TEN TEC FAN FOR LIFE!

JP-1 is the 2-pin header on this board. It is adjacent to the heat sink and can be seen in the photos on:

JP-1 is the 2-pin header on this board. It is adjacent to the heat sink and can be seen in the photos on:

I must echo those sentiments Tom! Even though I have a couple other manufacturer rigs, Ten-Tec is still my manufacturer of choice. As I look at my rigs, 1 Icom, 1 Yaesu, 2 Kenwoods, 8 Ten-Tec! That includes an RX-340 I use for Short-Wave & Long-Wave listening.

From: n4be_jim
Topic: 8944 Message: 9029

I loaded 3.033xa tonight on my O-II. Sound wise I couldn't tell any difference from the previous 2.039 version. But when using HRD with the new version, the "S" level displayed by HRD seems to be 2-3 times higher than what the meter indicates. I switched back to 2.039 and HRD's "S" display follows the meter better. HRD queries the Orion and displays the response as a number and a bargraph, so the O-II with 3.033xa seems to be returning higher values than real. Not a how stopper for sure, but I decided to go back to 2.039 for the time being. 73, Jim N4BE

Jim: I also updated my Orion II, and after that my N4PY software's s-meter reads full scale.

I've done a reset, etc. and it still shows full scale. No big problem, but interesting.

9031. 565 Display Replacement

From: franklincloud79
Topic: 9031 Message: 9031

Would it be wise to buy a spare blue display for the 565 Orion?
I have just bought the 565 and wondered how long the existing display
would be available from Ten Tec. Thanks for any opinions.

Frank

I think it depends on your definition of "wise".

I bought a spare blue display and put it on the shelf. So far, I haven't needed it.

Maybe "wise" depends on how long we (and the radio) live.

I would advice to first do the LCD current saturation fix :
http://www.tentecwiki.org/lib/exe/fetch.php?media=playground:orion_lcd_current_reduction.pdf

It includes implementing an eight (8) ohm resistor into the back-light wire to reduce the current to the LCD.It was a quick & easy fix AND enhanced the overall contrast.
It takes about 10 minutes after switch-on before the display has its full contrast.

My 565 is in daily use since 2004.

Wes, I just use Webster for my definition which is having or showing good sense or good judgement. I don't know what Ten Tec's policy is for stocking parts for discontinued transceivers, so though someone with more Ten Tec experience might enlighten me. Thanks for the reply.

73,

Frank

9037. Re:3.033xa Update. New meter behavior with our favorite rig control software.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-14 08:22:46 UTC
From: kc2qma
Topic: 8944 Message: 9037

The problem is not the Orion II it is the way the N4PY, HRD or our other favorite rig control software reads the new Orion II S-meter data over the serial port from your rig. Your rig control software gets the s-meter level from a data stream over serial port on the back of the Orion II and then our Rig control software then takes that data and translates it to an s-meter reading in our rig control software.

Let me try to make this a little more simple. Before the Orion II update when the Orion II showed let's say S-5 it would show about S-5 in your rig control software. However with the new Orion II update the data the Orion II sends over the serial port to your computer is a little different than before, so the rig control software now might display S-10 or some other incorrect value when the Orion II shows S-5 on the meter.

So what needs to happen is the developers of our favorite programs will have to update their programs to match the new meter functionality of the new Orion II update. this should be no problem for N4PY and Ham Radio Deluxe.

Some rig control software allows you to manually "calibrate" the S-meter with your rig. For example Ham Radio deluxe allows Icom users to calibrate the HRD S-meter with the Meter in the Icom radio to deal with this exact issue.
To see this in HRD go to the options menu and look for ICOM Calibration. (This will only work with ICOM radios.)

I hope this clarifies this a little.

The problem with your solution (making the rig control programs change) is that you would now need different versions of the same rig software for each Orion II firmware version. The I-II firmware should present the same numerical values for each S-unit value regardless of how the S value is calculated. It's fairly standard practice in industry to adhere to interface definitions where possible when updating. IMHO. Jim N4VE

Yes Jim, I forgot to add that at the end of the last post. That TT would have possibly to re-adjust the S-meter serial data code to match the original code from prior versions. BTW this is not my solution it was just an explanation of why people are seeing these high S-meter readings in their rig control software.

Understand from the discussion below the 566 s meter values over serial port are incorrect or always maximum?

I just checked on the 565 (sorry no 566 available) and I found that the s meter calibration table values match the serial control values nicely (?S command)..

Did you compare 566 s meter calibration values with serial control values as well? Are they not the same?

Prior calibration feature it was up to the control programs to guestimate the translation between ?S value and s meter displayed within the program. To my knowledge there has not been a reference chart published..

With the new calibration feature the reference chart became available. If that means the software developers would need to update their s meter tables... well thatś what they would need to do I guess.

best regards, Onno

Best regards, Onno

Yes, Software follows hardware. How can a software company tell the maker of the ORION II "you need to change your product" so our software works better!

The problem I see with that is the beauty of the new OrionII software is it let' s each user tune the S-meter to each radio/analog meter combo. Hence, there is no "standard value" to pass along the third party software.

John, K4SQC

Understand and agree with you.

To me the 3rd party software should take into account the following;

1- (firmware) version detection should be included in order to coop with changes. Take the SAF feature which will only work with a specific firmware. And recently the new s meter calibration feature.

2- The s meter calibration feature compensates for the analogue meter deviation. Each orion could have a different deviation. If you don't care about improved analogue s meter reading you could use the default values which are equal for all units.

3- Indeed this means that 3rd part software would need to offer a similar calibration feature to match the readings correctly. To me that makes sense?

4- The s meter calibration feature seems pretty unique as I have not seen other manufactures offering this type of adjustment. It does explain the newly found challenge :-)

I am cautiously taking side here. To me TT addressed an internal digital / analogue deviation in a nice way and that has been pending for a long time. The remote control software can be made more accurate if it includes similar approach.

Best regards, Onno pa1ap

To all,

As a software developer for a product that works in the field on units that have been working with external programs already, I need to ensure that my software updates to my rigs are compatible with existing programs. I can add functions, and add software interfaces, but I need to ensure that changes do not break existing software programs interfacing with it already in the field. Of course, there may be an instance where I would need to get with the N1MM/N4PY/HRD/Writelog/etc authors of the world and inform them of a change in protocol so that they are ready when I release (and yes, I have done that in the past). e.g. some know to look for version xx before they enable the SAF menu items. Others know to look for version YY before certain 588 features, etc.

Now, with the given SMeter SUnit/signal strength item, what we changed in calibrating the SMeter display has nothing to do with a change in the SMeter value returned in serial queries by computer software programs. An S9 should still come back as an S9. It is based upon what the rig sees and calculates from hardware as to what an S9 is. The only thing the calibration procedure does is permit a guy to fine tune his SMeter readout for what an SMeter value of S9 measured by the DSP, changes the voltage level to the meter for that measurement, and for each Sx measurement along the way. This permits the meter readout to be calibrated mainly for when it ages. Coming out of the factory, this should be correct, but over time and possibly even ones from the factory, may not show an exact S9 when an exact S9 signal is input to the radio.

I can't look at it now, but I do have it logged to look at for a coming release, ensuring that when I put in an exact S9 (and other levels) of signal on the antenna of the rig, that the exact S9 value is returned in the serial query to the software programs on the PCs, so that logging programs and N4PY programs do show what is exactly coming in from the antenna.

Appreciate the inputs, will look into it,

Thanks, and 73

9045. v3.033xa Firmware (Orion II)

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-17 03:15:45 UTC
From: w6enz@...
Topic: 9045 Message: 9045

Has anyone else had the problem with v3.033xa firmware that after the Orion II is powered down for the night and then powered up the next morning the main receiver does NOT receive any signals and just has a loud popping noise. At the same time, the RX-366 sub-receiver operates normally. Returning to v3.029 firmware, both receivers work without any issues. A RAM clear and Master Reset was performed when installing the v3.033xa firmware into the Orion. Thanks: Rick -W6ENZ

Hmmmmm.....funny you should ask! I haven't upgraded my Orion II, but am running firmware version 3.029 and have a similar problem. Once the radio has been on a bit and warms, you merely touch the volume control and all suddenly works well. I only recently noticed this a few weeks ago.

Hello Bill,

Thank you for your email! Yes, that is interesting.... I think I will try to load the v3.033xa again and try touching the volume control and see if it acts the same way as yours does.

I will keep in touch and let you know if it acts the same way here.

Thanks George and Jerry. Well, perhaps I may try to re-load the firmware. I had some trouble using my newer computer running Windows 7 loading it the last time. If that doesn't work, then I will most likely try a master reset.

I'll let the group know how I make out perhaps later today.

From: David Little
Topic: 9053 Message: 9053

I recently traded for an Orion II with the updated second receiver.

The original second receiver was also included in the deal.

Is there any value or need on these, or are they fairly common and flooding the market?

Has anyone tried to use one of these to create a band scope that was fast enough to get out of it's own way when the resolution is zoomed to useful proportions?

Info on the board:

Top of board:

78220 Rev E Silk-Screened

81907 Silk-Screened

427-50 Hand Written in permanent marker ink

Bottom of the board:

78220 Rev E Silk-Screened

985 Hand Written in permanent marker ink

Since upgrading to 3.033xa I have not had volume control issues. With
3.029, the volume control would quit working. If I tugged on the knob,
it would start working again. Since upgrading, volume control works all
the time, no tugging required!

Hello John,

Thanks for the info. I have tried v3.033xa again today and after leaving the transceiver turned off for about 2-1/2 hours, the main receiver just crackles and pops while the RX-366 sub-receiver works OK. Tugging the volume knob or adjusting it does not bring the main receiver back on line. Oh well, back to the drawing board as they say.

Sorry, I see that you did so when you loaded the firmware. Never mind.

9058. 500Hz and 250Hz filter IMD3 degradation.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-17 21:02:09 UTC
From: Pierre Rothenburger, F3WT
Topic: 9058 Message: 9058

Hi all

It is or was known that using filters 217 (500Hz) or 218 (250Hz) degraded the IMD3 of O1.
In O2 this has been changed so as NOT to cascade the CW-filters with stock-filters in place, but rather substituting them instead.
Sherweng ranking table showed that degradation.
As a result quite a few O1 folks - as I do - use an Inrad filter 762 600Hz wide swapping the 1KHz stock-filter instead.

While I find this completely satisfactory I still wonder :
a) if the reason has been given or documented ?
b) whether any mods (HW es SW) exist to mimic O2 by paralleling filters 500Hz or 250Hz ?

For a) I made following observation:
With NO ant connected, a 500Hz (8poles- 217 filter inserted indeed in slot 500Hz and enabled), by narrowing the BW button through the 500Hz
level I noticed 2 things: clear audible reduction in noise , which does not surprise me, BUT a clear visual INCREASE of the S-meter noise level by .5 to 1 S level.
Question:Is it not a OVERCOMPENSATION of insertion loss of 217/218 by its additional amp which causes that Sherweng reported IMD3 degradation ?
Or anything else?

Topic: 9058 Message: 9059

My understanding: the change wasn't about cascading the filters. The change was going from 8 and 6 pole cw filters in the 565 to 4 pole cw filters in the 566 and eliminating a stage of amplification that was needed by the higher loss filters. The extra IMD was attributed to the amplification stage.

The work-around for the 565 was using the 1Khz filter slot and a 600hz 4-pole filter that didn't pass the signal through that stage of amplification.

Interesting John! I don't have to tug on the control to get the RX to work, just turn in a bit and the RX works. The radio just has to warm up about 10 to 15 minutes, the the volume control adjustment does it!

I think I will try a master reset to see what happens, Just have to write all my menu info down.

Yes, that problem occurred precisely in that manner with me too, just today.
No audio except for random popping, and no transmit power in CW or Tune as well.
A RAM Clear and Master Reset fixed it.

Hi Dave,

Well, I'm sorry to hear that you experienced the problem too. However, I glad to know that I am the only one who has had it.

Dave, you might want to keep an eye on it. I have downloaded v3.033.xa firmware a number of times now, including RAM Clear and Master Reset procedures. And, yes, it fixed the problem immediately. Also, powering off the radio and waiting a bit (even as long as a half hour) and the radio still worked. I thought that the RAM Clear and Master Reset fixed it too.

With my set, if the radio is powered down for a longer period of time and then powered up, the problem returns. The length of power down time where subsequent failure occurred happened after an all night power down period and today I had the same results after a 2-1/2 hour power down period.

Anyway, you may want to observe your's a bit and see if the problem returns. Good luck with yours.

Oh yes, would you let me know if the problem does come back to your transceiver?

73,
Rick - W6ENZ

Frank, this is copied from another forum.

>>>> On 1/14/2013 11:05 AM, Al Lorona wrote:
> There are at least two other ways of knocking down interference from nearby AM
> broadcast stations. Each requires the choice of a particular type of antenna.

The
BEST way to kill AM broadcast interference coupled via the antenna is
with a high pass filter. This concept is far from new -- it's been
around since the 1920s. When I lived in Chicago, I used the ICE model
BCB, which is pretty decent. It's rated for 100W. When the ICE
owner/engineer died a few years ago, the company was taken over by one
of the employees under a different name.

WX0B (Array Solutions)
was a distributor for ICE, and is selling AM broadcast filters built by
W3NQN. One model is designed for receive only, so would be used at the
RX antenna patch point with a K3. It is a VERY sophisticated filter,
designed for VERY sharp cutoff so it can eliminate stations at the very
top of the AM band just below 160M. It sells for $225. Another is rated
for 150W, with a less sharp cutoff (but still a VERY good filter), and
sells for $189. W3NQN filters are pretty much the Rolls Royce of
filters.

Array Solutions also builds their own RX only filter for
$56. The cutoff is not nearly as sharp nor as deep as the W3NQN
filters, but would likely be sufficient if your interference is below
about 1300 kHz.

http://www.arraysolutions.com/Products/BCB%20RF%20Filters.htm

>I have an AM broadcast station about 6 blocks from me. The Orion 1 I just bought is
picking up the station not on the receiver but when I use the push to talk in the SSB mode.
The station is picked up by the mic circuit to the extent the ALC light stays on . It also

puts out full power when there is no speech in the mic even with my hand over the mic and the station comes through the speaker. This only hapens when the push to talk is activated to get on SSB. I cannot use the radio when the station is on the air. I have an Ice brocast filter in the feed line at the transceiver and it blocks the station in receive.
>Any comments would be appreciated to solve this problem. My Ten Tec Omni 6 plus operates just fine with the filter. I have a second filter for the Orion and have switched them to check them. Both OK. I ran a new braided ground strap from the Orin to see if that would help No improvement.

If it is only happening on when you hit the TX button, I would suspect it is entering via the microphone cord. Check with the folks at perhaps Heil microphones for some type of solution, such as putting a torrid on the mic cord, or perhaps a different mic cord or even maybe a capacitor across on of the leads to ground. Just some ideas.. tom N6AJR

There should be a logical explanation for the rf detection... I know several contests stations running multiple orions and they are able to work without problems.

Couple of questions;

1- did you disconnect all cables and options (mic, headphone, keyer, disconnect too) except for power supply and antenna? Problem still occurs?

2- still following point 1, does touching the rig change anything? Does touching powersupply change anything?

3- connect the mic and repeat #2

4- is the mic cable shielded and does the shield make good contact with the chassis? Remember there is no ground pin on the 565 and ground contact is made through the plug house / ring.

5- Although I do not have an am station next door I included a ferriet core for both mic wires inside the orion. The 565 is as you found very sensitive for rf detection through the mic input. Ten tec even released a mic filter board at the time since many hams faced rf detection. The filter board is nothing else than a low pass filter.

Before taking #5 I would suggest to double check #1-#4 and confirm behavior. Please let us know how it went?

Best regards, Onno de pa1ap

Forgot one more isolation step: only connect power supply and connect dummy load to the antenna. Problem still occurs?

Some good advice has already been given. What mic are you using and how is it wired to the Orion? And is the mic connection exactly the same as the Omni 6?

I would also try winding the mic cable several times around a ferrite toroid near the plug end. A good ground and good grounding scheme are also important in your situation.

If you then still have problems, please confirm that if you unplug the mic, the ALC will not light up when you go into transmit mode. If it still lights up, switch SSB - TX Audio Source to "AUX" and repeat the test and tell us if it still lights up.

I would never see that as with the exception of a power outage or two, my ORION II has never been shut off. In my 45 years in the business I have found that electronic devices break down more with on / off operation than if you just leave the device on (with the exception of power amplifiers and a few others).

Subject: [orion565] v3.033xa Firmware (Orion II)

Has anyone else had the problem with v3.033xa firmware that after the Orion II is powered down for the night and then powered up the next morning the main receiver does NOT receive any signals and just has a loud popping noise. At the same time, the RX-366 sub-receiver operates normally. Returning to v3.029 firmware, both receivers work without any issues. A RAM clear and Master Reset was performed when installing the v3.033xa firmware into the Orion. Thanks: Rick -W6ENZ

Bill,

I had the same issue as you. The volume would sorta "drift" to off. A quick touch of the AF knob would bring it back. I lived with this for quite some time. Later I started having other problems too. The ATTEN and A>B buttons failed to work. I did the resets and they would go back to working. Happened again so I upgraded the firmware and did the resets and everything worked fine for a bit. Then it came back.

The final solution was to replace the battery.

Everything is working fine now.

Frankie,

That may be my problem. I forgot exactly how old this Orion II is, but I know the battery has never been changed on this radio, or any of my other rigs. Might be a good idea to go through all of them and replace all the batteries.

Thanks for the heads-up!

Sam,

I have often thought of doing just that. My shack is located in my basement where I built and finished a separate room where I have all my ham setups, new as well as boat anchor operating positions. In back of my I have my workbench with my scope, spectrum analyzer meters & generators etc for working on gear. In the winter like this past week, where the temperature for a high yesterday was only 20°F outside and in the morning was close to 0°, my ham shack temperature in the morning often is only in the 40's. I have a heater built into the wall of the room and in the morning bring the bring shack temperature up to 68° before I go in to operate. I also turn the radios on then too.

At least, leaving the ham gear on may help. Right now, the only thing I leave on all the time is my frequency reference. Hmmmmm, food for thought! I can't do much else as I feel like sh*& ..... as I'm fighting the flu.

Time will tell which operational model provides longest operational dureation :-) One could claim switch off/on cycles will wear down components which are directly involved in unit power. On the other hand with modern equipment the dc-dc convertors have an inherent weak spot with the capacitors. Those capacitors are charged / discharged continiously and their operational lifecycle is around 50K -100K hours. Leaving the unit on would result in around 4000 days before it brakes and that translates nicely to 11 years... not to worry abou that I think :-) But looking at the LCD screen and backlight this might be a bit lower though.

I guess with solid state components the issue of component degradation is a lot less than with the older units. Either operational model would work well.

Best regards, Onno

Even as a Chief Engineer, I would instruct the disc-jockeys to leave all the equipment on during the night including the remote transmitter filaments and audio gear. I found that lead to a lot less repairs and preventative maintenance that I had to do. I'm no longer CE and the stations are on 24/7 now, but that worked for me way back then and still works for me personally now.

How long should a new replacement battery be expected to last in an
Orion 1? I replaced the battery in late 2011. What should I expect?

Yeah! I hear ya Sam. I started in broadcasting back in 1968 when we all had to have FCC 1st. Class Radiotelephone Licenses and we did the same at the station I worked at then. Even all the tube equipment too! Of course, I wasn't paying the electric bill. ;=)I guess it kinda becomes a habit nowadays with the conscious efforts to conserve electricity. But again, 1 or 2 radios wouldn't hurt I guess that much....especially since I'm not talking about one of my boat anchor setups which would most likely make me not have to run the heat in the basement ham shack. The tube rigs do a nice job of warming the shack! :=)

For everyone's FYI, I did a master reset and all is well. I still will most likely replace the battery in mine though to avoid future problems.

Using Heil proset 6headset/mic with Heil hand switch ptt.Using the heil adapter for both the omni 6+ and Orion exactly the same.
Tried a ferrite toroid, and several, however wrong mix for broadcast attenuation, did not work.Ground system cleaned , checked additiona braided strap replaced a wire. When I unplug the mic, the ALC will not light in the tune mode. Receive is no problem, no interference. Tonight when the station runs reduced powe, a qso station in Andover mast heard the mexican music from my station over the air even when the alc, nor s meter was not affected. I have some j mix snap on
beads ordered for the mic cord and switch cord. I also emailed Heil for any suggestions. I switched from mic source to aux, it still lights up. Thanks for the reply.

frank

I have an Ice filter on the Orion and have no problems with receive. The mic circuit is broadcasting voice from the station on transmit.
Thanks for the reply Jim. I'm just learning to use this message posting.

Thanks Tom, I think you are right about the mic circuit. I emailed Heil, but they are out of the office until Feb. Thanks for reply

Yes to number 1
no to # 2, tried # 3 several times have three different mikes for the Orion.
I don't know if the cable on the Heil Proset 6 is shielded or the Heil hand switch. Have emailed Heil, they are out of the office until Feb. Using the Heil adaptor which screws on mic connection to Orion, tight.I have not open up the Orion to check on possibility of #5.
Thanks for reply palap,
Frank

I know this is a long shot but Take the covers off the Orion and re-seat all of the mini-RG coax cables inside the rig.
You may have a loose (open shield) connection with one of the coax cables in the rig?
Anyway just a thought.

My apologies in advance if this has already been mentioned or does not apply.
I had issues with RFI on the audio and found that the Heil Audio Tip solved the problem.
Direct link is http://www.heilsound.com/amateur/tips/rfi_removal_mics.php
Or go to the Heil Website and click on their menu item TIPS which is near the top, right of center.
Then select the item "RFI Removal from Microphone Inputs<http://www.heilsound.com/amateur/tips/rfi_removal_mics.php>".
And while there you might take a look at some of the other tips.

I did this on all my mike's and it got rid of my RFI problems.
But you say you are using an adapter between the mike cord and the rig, so you may need to run a separate wire from the mike connector case to the rig ground.

Rolf I solved the problem this morning after getting some feedback from another ham K4TLJ. I read the manual on microphone wiring again.
I then checked the Heil adapter I was using for my proset. It seems that the ring provdes PTT ground on the Orion mic connector. The minus of the mic element is attached to the chassis ground. These two should not be interconnected. The Heil adapter did exactly that using a common ground which introduced RF into the mic circuit and it was transmitted on the air. I rewired the 4 pin Heil plug by cutting the push to talk wire. I then extended it back to the two small screws that clamp the cord and attached the wire to both. When I connected it to the Orion, there was no interference whatever. I made a contact today and had him listen, I also listened to my self on the mon thru the headset. Great audio nothing bad on it. This problem is solved and I appreciate all the input I received. Now I can enjoy my radio.

Slightly off-topic but may be of interest to those who shortwave listen on their Orion II's. I've found this online database of SW stations and frequencies to be excellent:

http://www.short-wave.info/index.php

I have no connection to the site, just found it to be a real aid in identifying what I am listening to on the SW bands...

Excellent finding and thanks for sharing. Looks like one to keep in mind: Ptt ground is not the same as mic ground on 565. Great to hear its working now even with an AM broadcast station as neighbor :-)

My initial thoughts were around rf leaking into you station somehow. Hence my questions around disconnecting everything to decouple from unintentional "antenna's"... Touching stuff would change the rfi since your body would introduce yet another unintentional antenna link.

Best regards, Onno pa1ap

9089. Orion 2 airflow.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-27 22:40:49 UTC
From: n9aop2000
Topic: 9089 Message: 9089

Today on the net,J.Henry mentioned adding a 120mm computer case fan on the speaker opening if you don't use the internal speaker in order to keep things cooler. Is it preferable to blow outside air in or blow the inside air out?
Art, N9AOP

Hello Art, It was me who mentioned the fan modification on the net today. You will need a 12v 120mm PC case fan. You want the air to blow out of the Orion case. This is a simple mod that does not harm the rig in any way but it will lower the case temp dramatically and extend the life of the Orion.
If you don't use the internal speaker just remove it and put the 120mm fan in its place. You can solder the fan wires to the12v power connector on the inside or you can run the fan wires through the case attach an RCA connector and connect to the 12v port on the back if you like.
Enjoy
73/KC2QMA
John

John, is the fan inside the Orion's case or on the outside?

Did someone make a heatmap of the orion to see which elements cause most heat? On the 565 i found the logic board to generate most of the heat and this is located within the front panel compartment which has no "air outlet" towards the area where the speaker is located. Instead it depends on small sleeves to the top..... and unless i am mistaken the bottom compartment has no "air outlet" to the top compartment.

Which heating problem is addressed with the additional fan?

Best regards, Onno

Onno, would the LCD front panel display benefit by additional air flow?
I'm most concerned about that component. Does this mod do much to improve
the cooling of the LCD?

Thanks & 73,

I do not know if the fan would be effective to improve airflow inside the front panel compartment but based on my previous findings its unlikely. On 565 the front compartment is pretty much closed except for the small sleeves at bottom/top of frame. I made pictures at the time I worked on this but finding them is the challenge...

I do not doubt the fan will improve the overal cooling. To me the question is around which area's really need additional cooling and if they are benefiting from top compartment cooling. The concern I have is the unexpected/unplanned dust collection by sucking Air into the orion.

Best regards,
Onno

Hi John,

It was not my intention to criticize the fan modification and my appologies if it came across like that. In my view this forum is about dialogue and challenging (in postive way) how improvements can be achieved. If my reply came across as negative my applogies.

For what its worth;

I actually spend a lot of time investigating the heat build up in the orion 565 many moons ago. In my findings the root cause of heat build up is the cabinet design which does not allow free air movement. Of course forced air circulation will help but does it address the root cause issues? I know from experience the 565 lcd heat build up is higher than a top cabinet fan can address unless you let it spin at huricane speed. In the end I changed the front cabinet air flow and the fan was not needed anymore.

Thats all I can share on this.

Best regards, Onno

Hi Onno,
Can you provide more detail on the mods you made for improved airflow? Perhaps you have already?

Hi, Would it not be wise to install an interal temperature guage like those you can buy which stick onto your windscreen in your car to tell you the outside temperature. I think a couple of these installed into the rig and monitored before pulling the Orion II apart.

Very good idea to arrive at heat mapping indeed. Please keep in mind the 565 and 566 use different components and hence outcome can be different. regards, Onno

Very good idea to arrive at heat mapping indeed. Please keep in mind the 565 and 566 use different components and hence outcome can be different. regards, Onno

In my findings the root cause of heat build up is the cabinet design which does not allow free air movement. Of course forced air circulation will help but does it address the root cause issues? I know from experience the 565 lcd heat build up is higher than a top cabinet fan can address unless you let it spin at huricane speed. In the end I changed the front cabinet air flow and the fan was not needed anymore.

FYI My Orion II is just slightly warm when running my fingers along the top case above the LCD display, even when the rig is on for hours on end. If it was blazin' hot I might consider this mod...

On Mon, Jan 28, 2013 at 9:56 AM, kc2qma wrote:

Onno, No offence taken. I am just offering a simple solution to a problem. Yes Onno the Orion case design could have been a little better in reference to its cooling design. However this simple fan mod is easy for almost all Orion owners to perform and I does not require any (Hard) change to the Orion like cutting into the case or modifying any of the electronics. I think most users would be a bit apprehensive about doing that to their valuable Orion. Also these fans can be bought for under $5 USD online so it is also a very inexpensive mod.

I have done this mod to my Orion 2 and I assure you it Works great! Is it perfect, No nothing ever is, but it is harmless to the Orion and is easily reversible.

So again if you feel your Orion runs a bit too HOT for you then give the fan mod a try. Or don't it is up to you.

NOW HERE IS THE INSTUCTIONS FOR THE "ORION FAN MOD" for Orion owners that want to give it a try:

Fan Type: 120MM Ball Bering type (Not sleeve)12VDC @ 0.75A or less (1800 rpm or less) you want low speed.

You only need a 2 wire fan (red & Black wires) if the fan has 3 wires (Usually a white wire) you will NOT use the white wire. It is just it is a speed sensing wire for use in a computer application. Just cut the extra wire off the fan. These fans usually come with some kind of connector on the wires just cut the connector off the fan.

To mount the fan you need to remove the top cover. Disconnect the wires from the internal speaker and remove the bracket that holds the internal speaker.

Now and remove the speaker from the bracket. Save the speaker in a safe place so you can replace it in the future if you decide to.

Now let's mount the fan to the speaker bracket. Make sure you note the direction of the air flow. The fan will have arrows printed on it to show the direction of the air flow. You want the air to exhaust or blow out of the case so mount the fan so the air blows up and out of the case.

In some cases the screw holes for the fan will not line up with the original holes in the speaker bracket. Now don't panic you can either drill 4 new holes in the bracket or you can use 3M super strength double sided tape that can be found at your local auto parts store.

Now place the bracket with the fan back in the Orion and put the screw that holds the bracket back in place.

Now, you have two choices for connection the power to the fan. You can simply solder the Red wire to the +12 and Black wire to negative points on the circuit board at the
rear of the Orion. It is the solder side of the 12V accessory connector at the back of the Orion.
Or you can run the wires through the vent slits in the back of the Orion and add a Male RCA connector to the fan wires and plug into the back of the Orion's 12v port.

Place the cover back on the Orion and enjoy a much COOLER Rig!

You can also mount the fan outsite on top of the Orion over the speaker hole but you still have to remove the internal speaker. It's up to you.

Also remember that putting a regular old house fan so it blows the warm air from around the radio will also help the rig run cooler by moving the warm air around the radio out of the way. tom N6AJR

In a message dated 1/28/2013 5:09:00 A.M. Pacific Standard Time, john-m-junk@... writes:

How about giving the fan a try before criticizing it? Right now the Orion is cooled by convection and because heat rises any heat generated from the bottom passes by all the components to the top and this allows for a substantial amount of heat to build up in the case.

Forced air by the use of a cooling fan extracts the excessive heat building up in the case lowering the overall operating temps.

I guaranty you it will lower the overall temps throughout the Orion! And yes it does lower the temp of the front panel just try it and you will see for yourself I did and it works.

Now as far as the question of dust, yes just like any device that uses a cooling fan like your computer in your shack their will be some additional dust. And that's why I blow out any dust buildup in my PC, Linear amp, Orion, Power supply and other devices every 6 to 12 months with compressed air. I hope you do?

All I can say is it just works. Give it a try and see for yourself. If you don't like it put everything back, No harm done!

Thanks guys. It would be easy enough to take the speaker out and lay the fan on top of the opening with a shroud around it and then let the radio run for 6 hours or so and feel the front. I remember using the O2 at field day and the front did feel noticably warm after a few hours. I was going to call TT and ask them about this but never got around to it.

Wow! My O II has been on since 0530 (it is now 1212), and the radio is just slightly warm above the display.

Thanks guys. It would be easy enough to take the speaker out and lay the fan on top of the opening with a shroud around it and then let the radio run for 6 hours or so and feel the front. I remember using the O2 at field day and the front did feel noticably warm after a few hours. I was going to call TT and ask them about this but never got around to it.

It makes a difference if you are transmitting. Just listening doesn't make much heat. Try it for a contesting period and I think you'll notice a difference.

That was the deal with the Omni 6. During contesting, you could audibly hear the passband gradually shift more and more from the heat of transmitting. You could either just keep making corrections to PBT, or you could add a fan. A lot of guys did the fan for speaker swap back then - it's an old mod.

From: kc2qma
Topic: 9091 Message: 9115

Yes Bill I had my fan on the outside of the rig for a while and it worked so good I decided to mount inside for a clean look.

This simple fan mod is easy for almost all Orion owners
to perform and I does not require any (Hard) change to the Orion like cutting into the case or modifying any of the electronics. I think most users would be a bit apprehensive about doing that to their valuable Orion. Also these fans can be bought for under $5 USD online so it is also a very inexpensive mod.

I have done this mod to my Orion 2 and I assure you it Works great! It is harmless to the Orion and is easily reversible.

So again if you feel your Orion runs a bit too HOT for you then give the fan mod a try. Or don't it is up to you.

NOW HERE IS THE INSTUCTIONS FOR THE "ORION FAN MOD" for Orion owners that want to give it a try:

Fan Type: 120MM Ball Bering type (Not sleeve)12VDC @ 0.75A or less (1800 rpm or less) you want low speed.

You only need a 2 wire fan (red & Black wires) if the fan has 3 wires (Usually a white wire) you will NOT use the white wire. It is just it is a speed sensing wire for use in a computer application. Just cut the extra wire off the fan.

These fans usually come with some kind of connector on them just cut the connector off the fan.

To mount the fan you need to remove the top cover. Disconnect the wires from the internal speaker and remove the bracket that holds the internal speaker.

Now and remove the speaker from the bracket. Save the speaker in a safe place so you can replace it in the future if you decide to.

Now let's mount the fan to the speaker bracket. Make sure you note the
direction of the air flow. The fan will have arrows printed on it to show the direction of the air flow. You want the air to exhaust or blow out of the case so mount the fan so the air blows up and out of the case.

In some cases the screw holes for the fan will not line up with the original holes in the speaker bracket. Now don't panic you can either drill 4 new holes in the bracket or you can use 3M super strength double sided tape that can be found at your local auto parts store.

Now place the bracket with the fan back in the Orion and put the screw that holds the bracket back in place.

Now, you have two choices for connecting power to the fan. You can simply solder the Red wire to the +12 and Black wire to negative points on the circuit board at the rear of the

Orion. It is the solder side of the 12V accessory connector at the back of the Orion. Or you can run the wires through the vent slits in the
back of the Orion and add a Male RCA connector to the fan wires and plug into the back of the Orion's 12v port.

Place the cover back on the Orion and enjoy a much COOLER Rig!

You can also mount the fan outside on top of the Orion over the speaker hole but you still have to remove the internal speaker. It's up to you.

73/John

I do not see the need for a fan on the Orion. It was engineered to not require one. No harm in adding one within reasonable environment limit expected in a radio room. Just like my 43+ year old DRAKE TR-4 was also engineered to work as designed and still doing just fine without any aids. I prefer the total lack of fan noise in my radio room as long as I don't run up the PC or Linear. I mitigated most of the noise from the PC by where I located it. The Centaur linear is another story. It's a bit loud but I forgive it because it works so darn well.

Will my 565 Orion live as long as my TR-4 has without fan? We shall see.

I have received several emails on the fan mod. Do we condone it? Do we advise against it?

We at TEN-TEC have not tested this yet, so we can't make a specific yes or no comment yet. But I will try to provide a bit more information, and then you as a consumer can decide if you want to make the change or not.

There is a metal plate mounted to the bottom of the speaker. It is there because in certain instances the vibration and the magnetic of the speaker affected two coils below it that could affect sensitivity.

Granted, going from the size/type of magnet that is in the speaker, to what is in a fan, the amount of loop effect should be less. But, it is continually changing since it is mechanical and moving. Haven't tested it yet, so can't comment if it would have a negative effect or not.

Regarding heat.
Of course, as we all know, the MAIN contributor to heat in the Orion(s) is the Finals/PA, and of course during transmit. The absolute best way to help reduce this effect is to get the 310 fan kit.

The location of the proposed internal fan. In theory, yes, it should keep the internal main four compartments cooler, as there are cable and connector access holes in the chassis and a gap between the top of the chassis and the top/bottom cover that will permit air to flow through and around them. Placing a fan would pull air from the top four sections and parts of the bottom four, and parts of the front panel area.

After the finals/PA, the main contributor to heat is the front panel LCD and CPUs and Codecs. For the front panel, heat is dissipated through the vent holes above and below the front panel that runs the entire width of the front panel. Mounting a fan in the location of the speaker, theoretically will pull some heat from the top of the vent holes above the front panel, and cool air from below the front panel. Improvement in cooling?
Theoretically, but would have to test to see how many degrees it improves.

In TX, the best bet is the external 310 fan kit on the PA, because that is what gets the hottest.
For RX, this mod may help, but then it may be just as good to use strategically placed mini CPU fans mounted somewhere in the LCD panel area, but, I don't advise it because of how much room is there with the circuit boards that close to the chassis, let alone I'm not sure what you could mount it to to stay fixed.

TEN-TEC's inputs on this change?
If you think it will help your situation, using this modification is up to you. If you have issues with receiver sensitivity or sound, then remove it. Totally each Orion owners decision to make.

Thanks, and 73,
John Henry, KI4JPL

I just ordered the 310 fan retrofit kit for my 566.

Thanks, John, I believe your reasoning is sound. I don't notice a lot of heat from my O2, but I listen a lot. I did notice some above tepid warmness after SS in November, so transmitting is the main heat thing in my situation.

During long periods of listening, haven't noticed any appreciable heat on or above the front panel, but will pay closer attention now and see.

Thanks

John.

I agree with you.

I have always had the 310 fan kit for my O II, and the front of my radio barely gets warm, even when transmitting.

Thanks for setting it straight.

Thanks for the input John. Having had to open and repair my Orion II a couple of times over the years, I think I may give the change a try even though I already have the 310 Fan Kit installed on my Orion II and have had no heat issues. Any changes I observe in the performance (good or bad) of the Orion II, I will forward to you folks for evaluation.

I will be opening up my Orion II in the next couple days because of a different apparent temperature related problem. In my case, not because of the radio heating up, but it taking about 10 minutes to be on before I get audio. It is crazy in that after 10 minutes, soon as I touch the frequency dial, all works fine. I've got plenty of component cooler. ;=)

73,
Bill/K1FPV

>
> Regarding heat.
> Of course, as we all know, the MAIN contributor to heat in the Orion(s) is the Finals/PA, and of course during transmit. The absolute best way to help reduce this effect is to get the 310 fan kit.
>
> The location of the proposed internal fan. In theory, yes, it should keep the internal main four compartments cooler, as there are cable and connector access holes in the chassis and a gap between the top of the chassis and the top/bottom cover that will permit air to flow through and around them. Placing a fan would pull air from the top four sections and parts of the bottom four, and parts of the front panel area.
>
> After the finals/PA, the main contributor to heat is the front panel LCD and CPUs and Codecs. For the front panel, heat is dissipated through the vent holes above and below the front panel that runs the entire width of the front panel. Mounting a fan in the location of the speaker, theoretically will pull some heat from the top of the vent holes above the front panel, and cool air from below the front panel. Improvement in cooling?

Theoretically, but would have to test to see how many degrees it improves.
>
> In TX, the best bet is the external 310 fan kit on the PA, because that is what gets the hottest.
> For RX, this mod may help, but then it may be just as good to use strategically placed mini CPU fans mounted somewhere in the LCD panel area, but, I don't advise it because of how much room is there with the circuit boards that close to the chassis, let alone I'm not sure what you could mount it to to stay fixed.
>
> TEN-TEC's inputs on this change?
> If you think it will help your situation, using this modification is up to you. If you have issues with receiver sensitivity or sound, then remove it. Totally each Orion owners decision to make.

Topic: 3485 Message: 9123

I see on the HRD website where you purchase the latest software they have addressed some issues with the Ten Tec Orion. Does anyone run this 6.0 beta software and can you confirm they have fixed the s-meter issue with the Orion under the new version of firmware 3. It states they fixed Radio response and initialisation of the Orion Radio.. How does 6.0 beta run with the Orion 2? Any body running 6.0 beta? $79.95 shipped. ! AC5DF.

9124. Re: Orion2 cooling

The 310 Fan is for cooling the Heat sink for the final amplifier and the internal fan mod is for cooling the Orion internal case and components.
The optional model 310 fan kit is offered by ten tec for users who operate contest stations, digital modes or continuous carrier like AM mode where it would be necessary to dissipates the extra heat generated by the finals.

I'm well aware of what the 310 fan is for. I already have one on my Orion II. I'm considering the one in the speaker position to keep things nice and cool internally.

Well, I finally got to open up my Orion II so that I could try to trace down the weird problem I was having where when the rig was just turned on and cool, the audio level was way down or non-existent. Then after about 5 to 10 minutes, if I hit the VFO dial or volume control, the receiver worked normally.

Well, as things worked out, I looked at the output voltage on the power distribution board with my scope and saw a fair amount of noise on the DC line. Sure enough with my ESR meter, I checked C6 & C7 and "ouila!" They weren't doing what they are supposed to do! Little filtering at all. About 4 or 5 years ago I had a different problem and had those caps go south on me then. I replaced them (along with C9) with 470µf @ 35 volt LOW ESR caps. All has been well since till recently. Well, fortunately, I bought 6 caps last time.....so I had 3 replacements.

I know Ten-Tec acknowledged this was a problem before. I'm wondering if the quality of low ESR caps I bought(from DigiKey) might be a problem. Guess I'll look for some spare caps just in case it happens again.

Oh.....by the way, I didn't have a fan the right size to replace my built in speaker. I'm going to have to look around for one as in my post above regarding adding extra cooling inside the Orion II.

73,
Bill/K1FPV

Glad you found the problem Bill. I wonder if the cap failures are due to the high internal case temps?
John

Hi John,

I don't think so as I've never noticed any big heat problem. I'm not sure of the manufacturer of these low ESR caps I used. I bought them from DigiKey and they don't have a manufacturer listed. I was just looking at buying some possibly better caps. I've always had good luck with Panasonic electrolytics and they always got a workout in the broadcasting equipment I worked on. I'm going to try some Panasonic caps. The originals if I remember correctly were 470µf @ 16 VDC. I might try some 1000µf @ 16 VDC as I can readily get those from Jameco. I don't think the higher value of cap will be a problem. Right now I'm using 470µf @ 35 VDC with these caps being supposedly low ESR.

I wonder if Ten-Tec has had any such issues that I just encountered regarding the cap manufacturer of ESR caps?

73,
Bill/K1FPV

Hey Bill, Panasonic & Nichicon make Hi Temp Versions of their caps for industrial use digikey and mouser sell them. I try to use them in mobile and other harsh environments. I think others on the group have used them as well.

Yes John, these are supposedly the higher temp versions. They are 105°C capacitors...not the cheaper 85°C caps.

Yes those should work great!
Good luck
John

I was just looking at buying some possibly better caps. I've always had good luck with Panasonic electrolytics and they always got a workout in the broadcasting equipment I worked on. I'm going to try some Panasonic caps. The originals if I remember correctly were 470µf @ 16 VDC. I might try some 1000µf @ 16 VDC as I can readily get those from Jameco. I don't think the higher value of cap will be a problem. Right now I'm using 470µf @ 35 VDC with these caps being supposedly low ESR.

Yes, I know! Maybe those caps that lasted only about 3 or 4 years were just a fluke!

9133. Power on problem with my O1

Yahoo group: orion565 (2009 — 2013)

From: pierre_rothenburger
Topic: 9133 Message: 9133

Hi all,
I recently bought an O1 which worked fine until it started to get reluctant to be powered ON .
Now, when 'cold', I need to kick-start it (at the on/off button upper left on front panel) up to 10 times before it holds power.
After warm -up, no problem with off/on 's though.

Any clue as to where to look into before I start to investigate any further would be appreciated.

Thank you.

Hopefully just a bad switch. By the way. I usually plug my radios, power supplies etc. into a zip strip. I use the zip strip to turn on and off the power supplies, monitor and such.

I figure its cheaper and easier to replace a six dollar multi outlet power strip than it is to fix the radio or power supply power switch. I learned this trick with the old FT 101 series radios. those were a real pain to change their wimpy power switches. good luck.

Pierre,

If you turn it on, and it doesn't stay on, have you left it with the on-off switch on even though the radio is dead about 10 minutes, and then re-cycle the on-off switch? Does it come on then?

Also, have you opened the transceiver and observed the voltages coming from the power distribution board. Is there voltage? Also, if there is voltage, have you looked at it with a scope? In my case, it took 10 minutes for the radio to work properly, but the problem wound up being noise on the power line. I replaced 3 capacitors, C6, C7 & C9 with low ESR capacitors.

Good luck!

The power board (A9) is the most likely culprit, the 470uF electrolytics
are not up to the task and degrade over time, they need to be replaced
with high temp/Low ESR types.

Hi again,

Thanks a lot to your prompt replies, Tom (N6AJR), Bill (K1FPV) and Peter (OZ1PIF).

From what I noted so far, it doesn't seem to be the switch itself indeed, but rather those weakening capacitors.
Will do that additional recycling test as advised.
Thanks again so far.

Hi Pierre,

As was previously mentioned, that power distribution board (A9) is most likely your problem as I mentioned. C6 & C7 were the ones that I observed using my scope to be the problems. However, C9 is the same type. So I replaced all 3 capacitors with 105 degree C capacitors having a low ESR. I've owned my Orion II for a number of years, and this is the second time I've had to do this.

Good luck and I hope all goes well for you.

73,
Bill/K1FPV

On my O1 I have already replaced the caps on A9 and the power on/off was not the issue.it is now though. Mine is not the power on but OFF.. a lot of time I cannot power off with the switch. I can leave it in the OFF position and the rig keeps on playing for several minutes then it power downs.. thinking it might be the switch I replaced it and still had the issue. I called TT and was told it was a relay on a power distribution board. For the longest time until last week everthing seem to be ok until I had a quick power outage and after that I'm back to the same old problem..rig stays on for minutes after turning the switch off..

John

9140. Rude sales at Ten Tec

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-12 14:56:57 UTC
From: w3etc
Topic: 9140 Message: 9140

I wrote a polite email to sales at Ten Tec asking if they had any plans to come out with a higher powered solid sate amp to go along with my Orion II. The response was and I quote.

No

Stuart Banks
Ten-Tec Sales

While that certainly is an answer I expected a little more of an answer. I wrote Elecraft and Wayne himself wrote me back. I wrote Array solutions about the Acom 800 and Bob wrote back a nice lengthly email. Maybe it is just me however if I was in sales and a customer that has spent a fair amount of money in the past asks about plans or purchasing a $3000 plus amplifier I think I might offer a little more insight than "No".

I don't know Stuart Banks and he may be a wonderful guy but I am not feeling the love from Ten Tec.

Perhaps Stuart has not yet taken his Customer Service 101 course. I attended the Orlando HamCation over this past weekend and Ten-Tec was not there. Word on the floor was that they had pulled out at the last minute. A lot of speculation was swirling that there may be trouble in Sevierville.

I have to echo your statement Barry. I'm sure one thing that Ten-Tec must consider is, "Will the effort and expense (Yes it is a big expense)be worth it in the end."

I know, I was the head Radio & Audio Accessories design engineer for an electronics company and we usually attended I.W.C.E. in Las Vegas every year. Let me tell you, by the time you pay for floor space, shipment of equipment to the convention site, air fair for 3 to 4 people to attend, and finally hotel expenses for those days, you have to ask yourself, "will it pay me back in increased sales?"

I suspect, Ten-Tec did the same thing I used to do and figured that there won't be enough potential customers for this convention to make it pay.

Just my 2¢ worth on the subject!

That is a problem with email. You have to read what is there. If you imagine that there is more to it then it on you.
No means no. It is not the same as NO!!! which is louder :)
I have always had professional, courteous and knowledgeable responses. That was true with emails and with phone conversations.
I find your "rude" conclusions unfounded. It may not be the answer you wanted but it certainly answers your question.

Topic: 9140 Message: 9147

This type of discussions will always show positive and negative experiences and can go on forever. People can have good or bad days / circumstances and email is brutal when the context is captured badly or not received well. Once documented the "conspiracy theories" start evolving on the forums, often without the other side joining the discussion.

I suggest to call TenTec and ask them the question again if you are still interested. See how they respond and I can only hope the dialogue will be more fruitful.

Best regards, Onno pa1ap

(I agree "no" is a bit short for any commercial company but I also believe people can make mistakes and a second chance makes a world of difference in most cases)

As well as checking those caps on the A9 board (which I've had to
replace in my O1),
take a close look at the DC power connector bringing the 13.8 into the rig.
Just a week ago I had to repair it on my rig. One of the pins was
oxidized, also it was not making a tight connection and plastic of the
plug on that pin was discolored (brownish) from heat and high resistive
path.

Good luck,

I agree that a simple one word answer containing the word "no" is not a very smart answer from a commercial standpoint. The person at TT has to understand that he or she is in direct contact with a potential customer and that this "point of contact" is critical to make the proper impression.

I agree with Tim. As an outside representative of a large insurance company, I am constantly reminding all of our home office folks that everyone, ultimately, is a salesperson, and to remember that at that moment, he/she is representing the company. If he/she is less than polite, curt, short or, gawd forbid, rude, then that reflects poorly on all of us.

No, a guy can have a bad day, no question, but a polite response is ALWAYS required. Stuart should/does know this, especially if, as his signature implies, he's a member of the sales team.

It would seem to me that a brief note to him (Stuart), politely stating your case, may be in order. It may be welcome, but in any case, you'll fee better without making him feel worse. In any event, TT monitors this reflector on many occassions, and that, in itself, may be enough to stimulate the behavior you seek.

Just my .02.

This topic has seemed to take on a life of its own. I do not want to necessarily perpetuate this dialog, but feel compelled to make a couple of observations.

First, regarding exhibiting at conferences, I have exhibited at hundreds of industry meetings over many decades, albeit in a different industry (insurance.) The fees for having a booth at these gatherings can range from $2500 to $15000 depending on the venue and the size of the conference (Orlando vs. Dayton.) That's just the start, since you've already paid about 10 grand for the booth display, artwork, etc. Then, you must consider shipping and setup of the booth at the target venue. Shipping costs can vary, as can the charge for Union workers to set up your booth. It ain't cheap! Then, you must consider travel costs, hotel costs, wining and dining prospective clients and the like. Once that is taken into consideration, the price tag escalates astronomically. My company recently attended a two and one half day conference in So. Cal, and the travel, hotel, etc. amounted to over 20,000 to send 9 people there!

So, there is no question about the expense involved in attending these conferences to exhibit. Most all companies formulate a budget, which would include product marketing to cover these types of expenses. For the company, the question then becomes how to best spend the money for the biggest impact and ROI (return on investment.) Looking at it from the outside, it may well be that Ten Tec decided it was more important to spend their money at other venues, where they would get a better response to their marketing efforts. Additionally, Ten Tec might feel their position in the market is somewhat secure, and chose to not attend, based on market research and actual experience. I do not believe Ten Tec is a publicly traded company, but probably a privately owned firm. As such, they do not have investors who demand certain return on their dollars. The truth is that because of the demand for profitability by investors, most big corporations must pander to them, turning them into quarterly cash cows, without much regard to long range planning. Although I haven't checked, I would guess that the Big Three, Yaesu, Kenwood and Icom have private equity ownership to a lesser or greater degree.

Second, let's look at market position and market share. The marketing budgets of the big three dwarf what Ten Tec has to spend on "getting their message out." Just look at QST magazine, where the big boys buy page after page of ads, whereas Ten Tec might have a one page ad. The market for ham radio gear is limited at the start. There are approximately 700,000 hams in the US. But there are 330 million US citizens who may be in the market for toasters and the like. So, it is a very small slice demographically. Consequently, the market focus is very narrow and with the budgets of the big three, we are looking at a David vs. Goliath scenario. How does a company like Ten Tec compete? The answer is product quality and SERVICE.

Third, let's discuss service. I completely understand the frustration of the gentleman who received a cryptic one word response to a well-intended question. Perhaps it could have been handled differently, such as "We have no present plans to produce a legal limit solid state amplifier. We have other projects on the board that have taken precedence." For me personally, that would have been a satisfactory response. I have never talked to Mr. Banks at Ten Tec, but I am sure his focus and that of the corporation is to provide exemplary service. Maybe it did not happen to the satisfaction of the questioner, but in my mind, it does not negate the thousands of positive interactions had by our Ten Tec faithful , and the dozens of interactions I personally have had with them over the years. Their service is what keeps them at the forefront versus their competitors. Just try to get a one on one telephone call with the engineers at the big three. On the other hand, you can talk to Mr. Henry there, or a VP. Just a word on product development. If a company is working on developing a new product to increase market share, particularly in areas where there is a chance to compete, it would not make business sense to tip off the competition as to your plans.

I have no financial ties whatsoever with Ten Tec. I own an Orion II and an Omni VII and love them. They are easy to operate, and unlike the competition, they don't have four deep menus on every button. These rigs compete very well with the top line of the big three. In my humble opinion, I want to see an American company hold its own and prosper against the big boys.

I apologize for the length of this post, but that's my input. Agree or disagree, I care not. That's the way I see it.

73,
Ralph NA6D

Perhaps Stuart has not yet taken his Customer Service 101 course. I attended the Orlando HamCation over this past weekend and Ten-Tec was not there. Word on the floor was that they had pulled out at the last minute. A lot of speculation was swirling that there may be trouble in Sevierville.

Subject: [orion565] Rude sales at Ten Tec

I wrote a polite email to sales at Ten Tec asking if they had any plans to
come out with a higher powered solid sate amp to go along with my Orion II.
The response was and I quote.

No

Stuart Banks
Ten-Tec Sales

While that certainly is an answer I expected a little more of an answer. I
wrote Elecraft and Wayne himself wrote me back. I wrote Array solutions
about the Acom 800 and Bob wrote back a nice lengthly email. Maybe it is
just me however if I was in sales and a customer that has spent a fair
amount of money in the past asks about plans or purchasing a $3000 plus
amplifier I think I might offer a little more insight than "No".

I don't know Stuart Banks and he may be a wonderful guy but I am not feeling
the love from Ten Tec.

Ralph;

Excellent post. I enjoyed reading your take on the subject.

My only input to all this is a response of "no" is not a good answer from TT. As you stated, it could have been put more eloquently. An answer like "no" means to me that I'm bothering them with the question.

I own an Orion-2 and love it.

I love my O1.
I also greatly appreciate the companies responsiveness.

A while back I posted here regarding an issue I had with my 565 while running it on SSB. The service manager of Ten Tec, Paul Clinton, emailed me direct and due to his generous help I was able to cure the issues. All in all it took three thoughtfully detailed emails from him which must have taken quite a chunk of time. Amazing!

Thank you Ten Tec, Paul Clinton and all the others working there.

I wonder if the question about future plans would have been answered at all from ken-yea-com? Highly doubtful.

Personally I liked the "no" given although I must say an answer of "nope" would have worked for me as well.

Things look much different from this side; we are just happy to enjoy 4 - 10 days on average of snow each winter period :)

cu in ARRL DX CW from PI4TUE

I am sure glad I live in Minnesota where we don't get the horrible winters
you get in New England!

I love my Orion, especially with the addition of the new RX-366
sub-receiver.

I hope to see you all in ARRL DX CW & SSB from the W0AIH multi-multi in WI.

Hmmmmm! I thought your winters are colder than ours here in New England Rolf! We might get more snow due to the close proximity of the Atlantic Ocean and the warm Gulf Stream that feeds the storms, but I was under the impression your winters are colder.

At any rate, I have antenna work to do in the spring, thanks to an ice storm earlier this winter.

You know what they say about an Antenna that never comes down.
It wasn't good in the first place. :-D   < BIG GRIN>

Comes spring, you'll be able to put up a bigger and better Antenna!
Get one of dem G5RV and you'll be able to talk around the world and make a lot of DX contact.
BTW , it'll work from 6 to 160m and it's the best thing since slice bread.

Better get my tongue outta my cheek, before I get into trouble.

((((73)))) Milverton.

True. Add another 3 dB if it 1) draws blood, 2) goes up in the dark, or
3) goes up during a blizzard.

Assuming the antennas are connected to a TenTec rig...

Rebuilt my SteppIR and raised it as Nemo's snow was already falling here in Albany NY last Friday.

Hiked up Mr Greylock in western Mass on Wed afternoon (3 hours, spikes on my boots) and operated QRP from the summit (SOTA).

Not saying I love the cold and snow, but resistance is futile . . . . and I hate just sitting inside the house.

Looking forward to playing with my 565/RX366 tomorrow morning in the dx contest (back on topic) and going hiking in the afternoon (32 deg).

The only solution I know available (there may be others I don't know of) is
TRX-Manager which includes a TRX-Acom module that will sync the 2000A/2000S
with the rig.

Would it be usefulll ffor orion owners to have a standalone controller box which can handle the Orion band connector and translate the status to any linear through various conversions including serial control? Does such device exist already?

I doubt amp owners would want to pay enough to make this a worthwhile development project. Also, the Acom amp is often paired with the Acom antenna switch, so a GUI is really needed for the user to configure antenna choices by band. That way, the software can switch both the amplifier and antenna switch at the same time depending on the Orion frequency. And to take it a step further, SteppIR users also need the frequency sent to their SteppIR controller and TRX-Manager software will also do this through yet another serial port. Bottom line: just set the Orion frequency and your amp is pre-tuned, your antenna is selected and your SteppIR is pre-tuned.

Barry,
Just downloaded TRX-Manager (French vers.) intending to run my O1 during current ARRL-test.
Plenty Omni's , one generic Ten Tec option to choose from - but no Orion!
Is the US vers doing it?(before I download again)

Pierre, I run the latest US version. Not only does it have the Orion, it has the Eagle as well.

If you set the "Line Out" connection to "Low," you can use the line out to feed your recorder microphone input. A small cassette recorder works just fine.

Hi Barry,

I agree for the Eagle, but I cannot find the Orion either, at least not in the Demo version.

9184. Orion I - Serial port

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-17 03:27:04 UTC
From: Steve
Topic: 9184 Message: 9184

How do I get Orion to talk to computer.
Have tried with Windows XP-pro and Windows 7-pro (64bit) machines with straight thru DB9 cable on XP box and with new Keyspan HS19 USB converter on Win7 box. But no luck.
I think I've read every post that came up when scanning for 'serial' in this group. Looks like others have had the problem as well.
But how does one get it to worK?
Thanks de Steve AA0P

9185. Re: [orion565] Recorder

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-17 03:33:20 UTC
From: Sam W Jacobs CET
Topic: 9181 Message: 9185

I use the line out set to "high" and feed my computer audio card's line input, and record it with my favorite computer audio program called "Rip, Edit, Burn". Although this is a paid program there are many out that are freeware or shareware.

I also have a mixer that is between the radio and the computer, but that's not needed. A simple RCA to mini-phone plug cable will work to connect the radio to the computer.

This way I can save QSO's to my hard drive, email them to friends so they can hear their audio, burn them to disc for my records, play them at parties, sell them on late night cable tv, or whatever floats my boat. But wait, there's more ...

73 !

If you set the "Line Out" connection to "Low," you can use the line out to feed your recorder microphone input. A small cassette recorder works just fine.

9188. Re: Orion I - Serial port

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-17 06:42:02 UTC
From: pa1ap
Topic: 9184 Message: 9188

There is a serial test program which will test the communication including cts wire. But I dont know if it still works for windows 7 /8.

The straight through cable needs besides rx and tx also the cts/rts (pin 4/5) wires to be connected. Without cts the computer will not be able to send data to the orion. Please double check that.

One thing to be alert on is static discharge to the rig. Please ensure the computer shares the same ground with orion to avoid blowing up the serial controller chip. Ensure common ground prior to connecting serial cable.

Using windows serial terminal program: speed at 57600, no parity, 8 bits and hardwared handshake. Once connected to orion, switch off orion and switch on again. The orion will boot and send out a command over the connected serial connection. This way you can check if the orion will send something to you. After that try sending a command: ?V

Let us know how it goes. Most cases I found the cable to be faulty or the serial usb driver was not installed.

Hope this helps and best regards,
Onno

Yes.

I built one to interface the O II to an Ameritron ALS 1300.

Works like a charm.

I am sure it could be used with other amps/

Would it be usefulll ffor orion owners to have a standalone controller box which can handle the Orion band connector and translate the status to any linear through various conversions including serial control? Does such device exist already?

9194. Orion 565 Power Relay Location

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-18 15:13:36 UTC
From: George
Topic: 9194 Message: 9194

I've been having problems turning on my Orion 565. Sometimes it would take five tries before the rig came on, sometimes it would start on the first try. Initially I suspected the power switch. I replaced it but the problem continued.
I kept reading about capacitor problems on the A9 power distribution board. In 2011 I had the rig at Ten Tec because of another problem. At that time I also asked that any improvements be installed while the rig was at the factory.
I made a call to Ten Tec concerning the power-on problem about a week ago and mentioned the possible capacitor problem as the cause of my problem. I was told that my A9 board was updated in 2011, hence it was thought not to be the cause. And because I mentioned that I hear clicks when I try to turn the set on and off, the technician suggested that the it may be a relay problem and I should first try cleaning the relay.
I thought the relay was on the A9 board, but I couldn't find it, and I didn't see any on an Orion II schematic in Ten TecWiki.
I also checked the power connection coming from my Astron transformer. The contacts were clean.
So, could someone please let me know the location of the relay, and/or suggest a possible fix. Also, where could I find a schematic for the 565.

Thanking in advance,

Electronically Challenged George, KE4HW

9195. No Ten Tec ads in QST and CQ magazine?

Hi all,

This is getting to be a nuisance. You all are like a bunch of spinsters discussing what's wrong with the neighbors because nobody has seen them for awhile.

It's all thoughtless speculating. As John K3UR suggested, call TEN-TEC directly and get it from the horses mouth instead of wasting bandwidth. I'm putting my flame proof suit on now.

73, Tony VE3DWI.

9198. Orion II For Sale

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-18 19:22:25 UTC
From: Richard Cash W4WU
Topic: 9195 Message: 9198

I thought that I'd offer this to this group before listing elsewhere:
Mint Orion II with all filters except the 300
Matching 709b speaker
302 Encoder/Keypad
712 Digital Adapter Cable
All items have the original boxes and manuals and all are in mint condition with no problems. The Orion II has the Clifton Labs buffer amp installed for the LP-Pan System. I also have the LP-Pan setup for an additional $300.
Package sale only $3300 shipped Fedex in US.
Respond to this email or call Dick W4WU 8644634205. Pickup in upstate SC.

Personally I would forget about the relay and go back to the A9 board.
Even if it was updated in 2011, I've had 5 of those go back SINCE 2011.
I keep one (1) on hand all the time just for the next time it goes bad.

My 2 cents.

Subject: [orion565] Orion 565 Power Relay Location

I've been having problems turning on my Orion 565. Sometimes it would take five tries before the rig came on, sometimes it would start on the first try. Initially I suspected the power switch. I replaced it but the problem continued.
I kept reading about capacitor problems on the A9 power distribution board. In 2011 I had the rig at Ten Tec because of another problem. At that time I also asked that any improvements be installed while the rig was at the factory.
I made a call to Ten Tec concerning the power-on problem about a week ago and mentioned the possible capacitor problem as the cause of my problem. I was told that my A9 board was updated in 2011, hence it was thought not to be the cause. And because I mentioned that I hear clicks when I try to turn the set on and off, the technician suggested that the it may be a relay problem and I should first try cleaning the relay.
I thought the relay was on the A9 board, but I couldn't find it, and I didn't see any on an Orion II schematic in Ten TecWiki.
I also checked the power connection coming from my Astron transformer. The contacts were clean.
So, could someone please let me know the location of the relay, and/or suggest a possible fix. Also, where could I find a schematic for the 565.

Thanking in advance,

Electronically Challenged George, KE4HW

Hi George,

The Orion and Orion II have over-voltage protection circuitry on the 13.8V power input. If your power supply would happen to exceed a little over +16V DC, the relay is held in the off state by that circuitry, and the power switch will have no effect. Sometimes a power supply with virtually no load will present a higher than rated voltage, and this could be your problem. An easy way to confirm that the relay has closed is to look at the +13.8 VDC output that appears on an RCA Jack on the rear panel. If the voltage is present, then the relay has closed.

The relay in question, K1, is located on the A0 board, which is mounted vertically on the back panel.

Howard Smith, WA9AXQ

Disclosure:
I am an Orion beta tester, and I have signed a Non-Disclosure Agreement with Ten-Tec, Inc. to provide firmware updates to Ten-Tec for the Orion 565 Transceiver.

5 A9 boards in 2 years? Sounds to me like you may have something wrong in your setup. Maybe your power supply has dirty DC or overvoltage or very high shack temps?
Just seems like a very high failure rate to me?

No! Sam is right! I too have had a number of times, the caps on the A9 board went south on me. The first 2 times, I didn't use Low ESR caps and they didn't last a year. With Low ESR Caps, they have lasted an average of 2 1/2 years each.

I now keep 2 sets of spares in my parts supply (6 caps). :-) No, it isn't the power supply as I've tried multiple supplies, both switchers and linear. Same results!

You forgot the bonus doubler, if you do 1., 2., 3. or 4. without help (as in all-by-yourself !). Plus if all 4 happen and you are by yourself, then that is worth +24dB.

73 !

True. Add another 3 dB if it 1) draws blood, 2) goes up in the dark, or 3) goes up during a blizzard.

Assuming the antennas are connected to a TenTec rig...

WOW I have a 566 OII, maybe the 565's have a problem specific to them? I have had my OII for over a year and haven't had one problem. Now I did do the internal case fan mod, maybe the lower case temps have helped keep the internal components happy?

You say that you are going to give the group a shot at buying it before to post it elsewhere!!
You have it on QTH tha same time as for the group? Hardly think this is fair to the group.

Good BIO you have John, I will have my bio up soon! It would be nice to have an Orion II for a second radio, but it is well made and I do not think it will clap out on me. Besides I have a ken wood 870 for a backup.

Hi John,

Well, that particular problem apparently is common to both the Orion I and the Orion II according to many posts I've seen here over time.

Like I previously mentioned, I replaced the caps with Low ESR type rated at 105 degrees C temperature. It is unlikely that temperature is the cause of the failures but more than likely the high amount of noise that I was able to observe with my scope on the line supposedly being filtered by the caps.

Your fan mod can't hurt unless it has affected the receiver as previously mentioned by John Henry. I have yet to perform that mod on mine. I'm going to look for a very thin fan to put in the place of my speaker. Right now, I'm addressing another problem that just popped up on my Orion II. When using digital modes and the TX audio coming in via the rear accessory plug, I get varying audio levels causing wild changes in output. This occurs only when the audio comes in via the rear plug. I'll most likely take my Orion II apart again in the next day or two so that I can trouble shoot it.

Bill, I believe you will find that is a product of the software. I was beta testing with John and I think when we hit version 3.026 the rear output RCA jack's audio started doing strange things such as pops, clicks, varying audio and the like.

It helps to have the AN (auto notch) turned off, but you will then hear tuner-uppers.

I do all of my ham audio recording using the REAR RCA AUDIO JACK and it worked great on software versions prior to 3.xxx.

John Henry is up to speed on all of this and intends on more experimenting with the next beta versions.

73 !

Hi Sam,

I haven't taken my Orion II apart yet, but noticed the audio fluctuations on the audio output pin of the 5 pin DIN connector where I use the supplied cable to feed my SignaLink USB when operation on PSK31 or JT65HF. I'm using the 3.029 version of firmware.

The SignaLink USB works fine on my Jupiter, Argonaut V and OMNI VII. I just assumed it might be an intermittent capacitor or something like that. I was going to follow the signal with my scope back to the source. The problem is it may work fine of 10 minutes, then all of a sudden vary wildly.....then calm down for a while before doing it all over again.

Thanks for the heads-up!

Bill/K1FPV

Hmmmmm, wonder if I should revert back to Firmware version 2.044A ? I only updated my Orion II a few months ago. I had no issues with version 2.044A.

From: Pierre Rothenburger, F3WT
Topic: 9194 Message: 9219

Hi Bill (K1FGPV) and all:

These questions (locating power relay) seem to relate also to my previous ON/OFF switching problems with my O1. Don' t they?
(I add OFF as a ham mentioned this)
Meanwhile, my O1 seems to be back to normal! A coincidently or causal relationship with my shack is heated now (due to currently colder weather/wx here) ?
Will see.
Probably a 2-cent question, although I am an electronic (but French) engineer:
what does ESR capacitors mean?
I may eventually have to put my sleeves up to dig and solder them into the rig indeed, as suggested .

Thanks you .

73, Pierre F3WT

9220. Orion 1 usage with a Hercules II

Yahoo group: orion565 (2009 — 2013)
Date: 2013-02-23 19:23:57 UTC
From: ih350u
Topic: 9220 Message: 9220

I have a Hercules II that is currently wired for remote use with my Omni VI+.
Can the Hercules be used in remote mode with a Orion by changing the plug to match the Orion's band data 15-pin plug or is the Orion different than the Omni? is the band data output the same for both? I know the pin out is differnt.
I would like to use the Hercules on the second VFO/sub RX for S&Ping. If it works Then I can keep my main amp tuned to my run freq.

Thanks

Paul, WG0G

Paul,
The band data output is different! If you can find a Ten Tec 311, it will serve as an interface between the Orion and cables to your amp. If you look in the past messages, you will find that they are very rare. Schemes for accomplishing the connection have been published a number of times.

Best of luck,
Ed Feustel, N5EI

Interesting development with the varying levels on my audio output of the accessory plug on the back. I used my Orion II on JT-65HF for about 2 1/2 hours today after doing a master reset and down grading to firmware version 2.044A. The Orion II worked flawlessly!

It looks like you called it right on the nose Sam! With the older firmware, at least on my Orion II, the radio seems to work fantastically.We will see what occurs over time. In the meantime, I'm looking for a 4" fan that is very thin and runs on 12 VDC for the speaker replacement mod.

Bon Jour Pierre,

Excuser mon Francais! C'est un long temp que je parle et ecrit Francais. Before I make a fool of my French abilities, it has been many years since I have spoken it. My grandparents spoke French and that was the only way I could communicate with them.

Low ESR capacitors are capacitors that have an extremely low impedance especially in noisy situations and can operate in higher temperature environments. Mostly the low impedance is the primary feature.

I recently purchased an ESR meter and it is a valuable tool in troubleshooting areas where capacitors are the suspected problem. I used to use them in troubleshooting equipment at the broadcast stations I worked at.

Hope this answers your question! :-)

73,
Bill/K1FPV

I and have the same results. I have tried some different things but
nothing has helped. I ordered a new battery for the front end, will
change it out and see what happens, but I don't think that is the
problem. I went back and try out different versions of the upgrades and
got different results. Instead of the main receiver not working the sub
receiver didn't work and things went from bad to worse. Reinstalled
version 3.036 and everything is working as it should. So I don't think
I have a hardware problem. I have talked to the tec department at Ten
Tec but no results yet. I am just wondering if anybody else has this
problem and if so found a solution. Thanks bob NR8L

Well, looks like it isn't the firmware! Yesterday, using Firmware version 2.044A, I had the transmit levels vary on me again. This occurs no matter what level I put the AUX Input Level at in the SSB menu. I'm using the 5 Pin DIN cable that came with the rig to connect up to the SignaLink. Using the same computer interface(SignaLink USB) on my other Ten-Tec radios (Argo V, Omni VII & Jupiter), output level remains constant.

Anyone else ever have this trouble? Looks like I'll be taking the radio apart in the very near future. Any suggestions would be appreciated if you have encountered this problem!

Topic: 9045 Message: 9226

I returned to version 3.028 as I didn't like the S meter bouncing all over the place.

When I was on 3.033 I didn't notice the problem you experienced.

> Hi Rick I am bob NR8L I too upgraded the firmware on my orion I I and have the same results. I have tried some different things but nothing has helped. I ordered a new battery for the front end, will change it out and see what happens, but I don't think that is the problem. I went back and try out different versions of the upgrades and got different results. Instead of the main receiver not working the sub receiver didn't work and things went from bad to worse. Reinstalled version 3.036 and everything is working as it should. So I don't think I have a hardware problem. I have talked to the tec department at Ten Tec but no results yet. I am just wondering if anybody else has this problem and if so found a solution. Thanks bob NR8L

9227. Question about using 1208 converter with the Orion

Yahoo group: orion565 (2009 — 2013)

From: w5kg
Topic: 9227 Message: 9227

I am putting together a 6 meter station and I had a couple of questions.
First, how well does the 1208 converter work with an Orion?
Second, how does the coverter connect to the Orion, menu setting and the like?
Any info on the 1208 would be appreciated.
Don, W5KG

Hello Bob,
Well, I have replaced the memory battery as well as the 470 uF caps on the A9 power distribution board and performed numerous RAM clears and Master Resets. Net result, the problem still exists with the radio not booting correctly after extended shut down periods.
K7NG and now your self have indicated that you have identical problems. Just wondering if there is any one else on the group who has had the same problem and maybe has some more suggestions on what we can try to be able to us v3.033xa firmware without having to perform a RAM Clear and Master Reset everytime we start the radio?

Rick,
Add me to your list. Also the memory mode labels are sometimes incorrect.....what should say ”AM” sometimes says “nAMe” OR there will be no mode listed at all......either “none” or “ “. Not a big deal, and it is minor enough that I have not mentioned these various bugs to John Henry yet.

9230. Re: v3.033xa Firmware (Orion II)

Yahoo group: orion565 (2009 — 2013)
Date: 2013-03-02 17:29:11 UTC
From: w2msj
Topic: 9045 Message: 9230

I too have very loud "popping" in the speaker but it may not be from the same cause as being discussed on this thread. Or, could it be? (I have used 3.033xa since it came out) A year or so back I successfully cured the "A9 board" popping with the prescribed cap change. Last week I very briefly (maybe 3 - 6 cw characters) transmitted into an open coax (between the OII and ASTU) at 100 watts. Connecting into the ASTU, properly adjusted, and all seemed OK. Soon thereafter there appeared a loud popping in the speaker when running 100 watts into a matched load (as close to 1:1 as you can read). Power to the antenna tuner remains at whatever the "PWR" control is set at. Reducing power to 75 watts the popping goes away. Occurs on both SSB voice peaks and CW. No popping is audible when AF/RF turned down i.e. even listening near the final amp there is no audible arcing.
Any opinions to the source? It would not seem to be software but?? Antenna changeover circuit damaged by rf? or ?

Topic: 9045 Message: 9231

Ignore my previous post. "doesn't seem to be3.033xa firmware". I did a RAM clear, Master reset and cleared user files, following step-by-step the ORION/ORION II RAM CLEAR instructions on the TT website and Master Reset in the OII manual. My problem was solved - no more popping when transmitting at 100 watts. The receiver seems to work normal again too. Someone once said: "when all else fails, read and follow the manual" At least it worked for me.

OK so the first try I pushed the lock button under the VFOA button instead of under the VFOB button - nobody reads perfectly. Lynn Finch, W2MSJ

As you may recall the original change on the electrolytic caps was from 85c to 105c. My friends tell me that the advantage to that was longer life expectancy, but not based on temp, just 105's will last longer under same condx as 85c's.
They also told me of horror stories about Chinese caps with bad chemicals and delayed failure!

Everything you mentioned Vance is true! Also, in the type of environment the caps on the Orion I & II power board are subjected to, you would be wise to use low ESR capacitors. There is a lot of noise and hash on those lines and low ESR caps do a better job of filtering it out. That was how I first found the bad caps in my Orion II. I happened to use my scope to measure the DC voltage and noticed all the noise on the what was supposed to be a nice clean DC voltage.

Bill thanks for your input.
Don't know how you got my e-mail as I had intended it for Pierre F3WT. In any event, we have been chatting about the odd failures of the O1's and to some extent the O2's. Reminds me of my days repairing large mainframe CPU's. Weird stuff almost impossible to pin down. I did not see a lot of noise on the +5 line out of the A9, but replaced the caps anyway. I measured the input to those switching transistors at around 34khz which should be pretty easy to keep clean. NOW I have a hard failure I can work on. Unfortunately, it is due to a workmanship error. Seems the soldering iron got damaged and instead of 700F is was only putting out 375F. Boy, did I do a screwed up job on those thru-holes! Have a couple of retired design engineeers helping we with this. One said if the 85C's were not up to the temp, I didn't need 105's, but the fire dept.hihi
Figured I can work on this bd on the bench and don't have to cart and setup the O1 in the shop. It's cold here and the shop isn't very warm. (Reno, NV).

I am trying to set up my TX audio and having trouble using a Heil proset6. I see in the menu a H/W mic gain which goes up to 18 db.
I cannot find a reference to that in the manual. I could have overlooked it. I set it on zero. My audio distorts now if I go over about 14 on the mic gain. Anyone have settings used for the Heil proset 6? and what is the H/W mic gain used for? Thanks for a reply.

Your audio distorts with MIC 14, H/W MIC Gain 0 and with SP (speech processor) off? Are you setting MIC so that the ALC LED just lights on voice peaks?

I assume you're going in the mic jack and have the Menu - SSB - TX Audio Source set to "MIC"?

The H/W mic gain is used if you need more mic gain than is provided by the front panel MIC gain setting.

Frank your problem is that you're using TX EQ of 0dB. Set your TX EQ to -15dB and see if the distortion goes away. The current iteration of the Orion speech processor can not handle low frequency energy - I know this from experience If you turn off SP, you can go to less bass roll off in the TX EQ. Personally, I've never used less than -10dB though.

Barry, your assumptions are correct. Mic is the source, using the front jack. I'll try your suggestions today. If I turn the mic gain up to where the ALC just lights, there is distortion so I keep it down to where a person listening tells me it sounds better, but not great. This is around 14. BTW my power out is about half from my AL 80 A when I do that. Thanks for the reply.

hi..

on both my 565 and 566 i have use a proset-6

I used the following settings
.
h/w mic gain = 4.0 db
front panel mic setting 35
.
tx bw setting = 2700
LF rolloff = 250
.
audio tx EQ = -15
.
SP varied from 1 to 4..usually set to 3
anything higher produce high distortion
.
it was OK but my Proset-5 produce much better audio results
which suited my tastes
.
Paul K3SF
.

see following for settings
http://www.ges.cz/sheets/h/heil_pse6.pdf

If I turn the mic gain up to where the ALC just lights, there is distortion so I keep it down to where a person listening tells me it sounds better, but not great. This is around 14. BTW my power out is about half from my AL 80 A when I do that. Thanks for the reply.

Thanks for reply Paul. I did use your settings and they did not help.
I found the problem by a suggestion from another station while on the air. The problem was that I had switched from one amp to another
some distance away from the Orion. I first operated barefooted using your settings and got wonderful audio reports. Then I changed back to my amp and had distortion. Connected my initial amp to the Orion and no distortion, great signal and audio reports. I either have a bad coax jumper or a bad ground to the other amp. Thanks to you and Barry for the help and I feel much better now that I am enjoying the Orion.
I will get it fixed so I can use either amp soon.

Frank

I made numerous contacts since making changes to the Orion and Amp. Great audio reports, no distortion. I have determined it was all caused by improper settings and a ground loop when I switched amplifiers due to poor practice of routing and not connecting the ground to a single point with other equipment.
Thanks for the help.

Hi Vance,

Well, I'm somewhat lucky here in that my service equipment is in the same room as my ham gear. I made a finished room in my basement, including heat. So, just a few feet away is my spectrum analyzer, scope signal generators etc. A few times, I had trouble with rigs and used a couple long lines to couple test equipment to the radios on the operating tables. I have a couple, one that is on the QRZ page, and another with my boat anchor setups.

Having been a design engineer as well as broadcast engineer at various points in my 45+ years in electronics, I've had the opportunity to see and do a lot! I was in my senior year of college when I passed my FCC 1st. Class Radiotelephone License and worked at a local radio station till graduation. I worked the second shift and basically babysat the transmitter from 4:00pm till Midnight. I occasionally made adjustments, recorded levels, and changed antenna patterns at sundown.

It was an ideal job as I was able to do homework and study all the slow time in-between. Regarding the 105 degree C capacitors, I always try to use them even if originals were 85 degrees C. It can't hurt! ;-)

73,
Bill/K1FPV

There is a lot of noise and hash on those lines and low ESR caps do a better job of filtering it out. That was how I first found the bad caps in my Orion II. I happened to use my scope to measure the DC voltage and noticed all the noise on the what was supposed to be a nice clean DC voltage.

Someone who can provide feedback on the original question? (see subject) Best regards, Onno

It started as a one-on-one e-mail exchange between Pierre and myself.
The subject of the exchange was a discussion of the 85/105C caps AND a
trend on these boards showing unusual failures on Orions. It seemed to
me that many 565's have marginal reliability as they reach 10 years of age.
That was it.

Hi all,

My Orion I makes a Master Reset every time I push the ON button.
So I find myself with a display showing "Master Reset complete" and have to renew the setup procedure at every startup.
Has anybody a clue of what might be wrong?

Do you have the original battery? A weak battery will make it do funky things.

With respect but I raised this question to the forum to ask fellow blue/white users about their experience so far regarding the actual screen behavior. Unfortunately only Piere responded . It would have been very useful to collect feedback / confirmation as I am investigating an alternative solution. Best regards, Onno

FYI

TO ALL

i uploaded file 'OrionBandData.pdf" which has AD5X design for a encoder which takes the band data output of an Orion and converts to proper levels the BCD data needed to band switching of yaesu as well as icom amplifiers.

I recommend this design as I have used it for many years now...

My thanks to AD5X for the design

9261. White lines on Orion LCD

Yahoo group: orion565 (2009 — 2013)
Date: 2013-03-15 20:44:00 UTC
From: R S
Topic: 9261 Message: 9261

My Orion has gradually developed a set of about 12 bright white horizontal lines that go across the LCD screen. They are spaced at random intervals and eliminate the black numbers and letters that they cross. The screen is becoming difficult to read, although the N4PY software allows me to see it on the computer. I tried taking the front panel off, pulling all of the interconnecting cables and treating them with Cramolin and reseating them, but that had no effect (except to fix the RIT/XIT that weren't working). Is there a fix for this problem or am I going to have to buy a replacement LCD?

Thanks and 73,
Stan, W4AG

"Orion Internal Contrast Control

From the Orion Reflector April 3, 2006

The internal contrast needs to be set. This control is accessible through a small hole on the bottom right of the front panel (looking from the front) with the bottom cover removed. Set the internal contrast to 50% and adjust this control for proper contrast.

Its a good suggestion to check contrast but most likely you have bad connection between the lcd foil and lcd module. If so, time to replace the lcd.

Regarding contrast control; the contrast potentiometer AND menu contrast control work together in the same circuit. If you can vary the contrast from complete black to complete white using the menu control there is no reason to tweak the potentiometer. The potentiometer is there to bring the contrast level in the neighborhood of good and the menu setting is there to fine tune it. And its convenient to adjust the potentiometer in such way that good contrast matches the default menu setting of 50%...

I am saving some cash to order true black and white lcd replacement. Its also using newer technollogy and it should be more crisp to look at as well contain onboard contrast circuitry. Goal is to arrive at better visibility, less puixel noise, less temperature variation. Lcd unit is around $80 and unfortunately for me the shipment and import tax exceeds that..... yuk.

Best regards, Onno

Ohno,

Yes, I tried the potentiometer adjustment but it did not make any difference. I have uploaded two photos of the screen to the photos section of the Yahoo group. One of them has the contrast turned all the way down so you can see the white lines better. I have a feeling I am going to have to replace the LCD. What is your source for the $80 replacement? If I sent you one labeled "gift" would you still have to pay the import tax?

Thanks,
Stan, W4AG

From: pa1ap
Topic: 9261 Message: 9267

The pictures confirm the horizontal lines are indeed not controlled. Did this occur gradually or suddenly?

On the replacement LCD;

1- TenTec offers a replacement screen. This would be the first source for all to use IMHO

2- I am investigating an alternative since I personally don't like the blue/white replacement display as offered

2a- you can experiment with alternative newhaven displays but you need to create you own connection cable as well figure out the logic. Newhaven screens are around $80.

2b- the display is actually standard 5.7" display and there are various sources which provide this. Pricing around $60.

3- for 2a/2b you have to take into account it will not be plug and play. Some displays require controller chip to be removed first... I am investigating a complete display kit. The risk for me is that I am investing without return on investment. Part of the hobby I guess ;-)

9269. RE: [orion565] Re: White lines on Orion LCD

Yahoo group: orion565 (2009 — 2013)
Date: 2013-03-16 18:15:37 UTC
From: Stan
Topic: 9261 Message: 9269

Ohno,

Thanks for the info. The white lines appeared gradually, over the course of several months. I didn't worry too much about them because I thought that cleaning the connections would make them go away. But no such luck. I guess I will have to call TenTec on Monday to order a replacement.

Please do keep working on your solution. If this happened to my Orion, it is probably going to happen to more of them in the future. If you could come up with something in color you would really be popular!

73,

Stan, W4AG

To: orion565@yahoogroups.com
Subject: [orion565] Re: White lines on Orion LCD

The pictures confirm the horizontal lines are indeed not controlled. Did this occur gradually or suddenly?

On the replacement LCD;

1- TenTec offers a replacement screen. This would be the first source for all to use IMHO

2- I am investigating an alternative since I personally don't like the blue/white replacement display as offered

2a- you can experiment with alternative newhaven displays but you need to create you own connection cable as well figure out the logic. Newhaven screens are around $80.

2b- the display is actually standard 5.7" display and there are various sources which provide this. Pricing around $60.

3- for 2a/2b you have to take into account it will not be plug and play. Some displays require controller chip to be removed first... I am investigating a complete display kit. The risk for me is that I am investing without return on investment. Part of the hobby I guess ;-)

Best regards, Onno

make any difference. I have uploaded two photos of the
screen to the photos section of the Yahoo group. One of them
has the contrast turned all the way down so you can see the
white lines better. I have a feeling I am going to have to
replace the LCD. What is your source for the $80
replacement? If I sent you one labeled "gift" would you
still have to pay the import tax?

you have bad connection between the lcd foil and lcd module.
If so, time to replace the lcd.
> >
> > Regarding contrast control; the contrast potentiometer
AND menu contrast control work together in the same circuit.
If you can vary the contrast from complete black to complete
white using the menu control there is no reason to tweak the
potentiometer. The potentiometer is there to bring the
contrast level in the neighborhood of good and the menu
setting is there to fine tune it. And its convenient to
adjust the potentiometer in such way that good contrast
matches the default menu setting of 50%...
> >
> > I am saving some cash to order true black and white lcd
replacement. Its also using newer technollogy and it should
be more crisp to look at as well contain onboard contrast
circuitry. Goal is to arrive at better visibility, less
puixel noise, less temperature variation. Lcd unit is around
$80 and unfortunately for me the shipment and import tax
exceeds that..... yuk.

They are spaced at random intervals and eliminate the black numbers and letters that they cross. The screen is becoming difficult to read, although the N4PY software allows me to see it on the computer. I tried taking the front panel off, pulling all of the interconnecting cables and treating them with Cramolin and reseating them, but that had no effect (except to fix the RIT/XIT that weren't working). Is there a fix for this problem or am I going to have to buy a replacement LCD?

Some background thought:

1- the 565 display is directly controlled by the cpu aand does not contain the nowadays common display driver chips.

2- the 565 display has standard 5.7" size and there are several replacements available but most cause an issue as described in point #1

3- most display units offer so called cn1 and cn2 connectors. One is direct without driver chips. But schematics need to be available to check if its compatible with the orion environment. And schematics are hard to get.

4- I am also investigating writing an orion to common display interface. This way most display units can be connected. Another advantage could be to use the same interface to provide an external vga port. Then you can connect a monitor to the orion. Challenge would be the resolution towards the vga screen.

5- with point 4 theoretically a color display can be driven using a two color plan. Background and foreground would be programmable.

Its complex but fun to learn too. Best regards, Onno

Another weird/wacky idea I am investigating / dreaming about;

1- build a lcd driver converter and offer a dedicated (usb) interface

2- when (usb) interface is connected the converter will stream the information to the computer

3- at computer the stream can be processed into a visual representation.

4- since the format is known the visual representation can be made touch sensible by mouse. This way functions can be changed by selecting it by mouse.

Best regards, Onno

You can actually do this now using N4PY's rig control software. In fact, it has occurred to me that you could load the N4PY to a tablet, giving you touchscreen control of the radio. Then, with a wireless headset/mike, you could control and operate your radio from anywhere.

Hi Guys,
according to the ARRL the kenwood TS590 is more efficient than the
TenTec ORIONII.
Can be trusted a test like this?
Look : http://www.remeeus.eu/hamradio/pa1hr/productreview.htm

Please take into account that there might be a difference in the numbers
when comparing the older product reviews (before February 2007) compared to
the later product reviews, due to *changes in the testing methodology*,
measurements filters, etcetera.

TenTec Orion-II, September 2006
Kenwood TS-590S, May 2011

Been on youtube looking and listening to several videos of the new Kenwood TS-990. It certainly looks like an electronic marvel but I can't determine if the receive audio is that harsh and metallic sounding or whether I'm losing something in the translation along the way. The DSP NR definitely adds discoloration, like they all seem to do. All in all, I don't see any reason to abandon my Orion II...

I have never known Kenwood for "bad" audio, receive or transmit. That is their trade-mark (remember the Kenwood home stereo systems ?). I just never liked their "look and feel". I like a nice screen like is found on the ORION II and ICOM 756(series), ICOM 7700 and 7800.

I also looked at the 990 and was SUPER impressed ! I'm not sure what they are asking but at some point (let's be honest) I might consider it. It's unclear if I would ditch my ORION II for the cash down payment, or keep it and buy the 990 outright, but this is the first Kenwood that I've seen that I've actually liked. Looks like Kenwood is allowing for real time imaging on their two displays, awesome !

I just never liked their "look and feel". I like a nice screen like is
found on the ORION II and ICOM 756(series), ICOM 7700 and 7800.

I also looked at the 990 and was SUPER impressed ! I'm not sure what
they are asking but at some point (let's be honest) I might consider
it. It's unclear if I would ditch my ORION II for the cash down
payment, or keep it and buy the 990 outright, but this is the first
Kenwood that I've seen that I've actually liked. Looks like Kenwood is
allowing for real time imaging on their two displays, awesome !

73 !

Subject: [orion565] Anyone going to ditch their Orion for a Kenwood
TS-990?

Been on youtube looking and listening to several videos of the new
Kenwood TS-990. It certainly looks like an electronic marvel but I can't
determine if the receive audio is that harsh and metallic sounding or
whether I'm losing something in the translation along the way. The DSP
NR definitely adds discoloration, like they all seem to do. All in all,
I don't see any reason to abandon my Orion II...

I think Kenwood took the hybrid analog/digital hf xcvr about as far as it will go with the TS-990S. I wonder when someone will produce a somewhat similar xcvr functionally that has direct digital conversion at its core, without requiring computer control.

Not this boy! The 990 has a lot of bells-&-whistles, but SO-SO busy. I listen with my ears, and not my eyes. To me it would be fun to spin the dial for a short time, but after a while that multi-multi knob radio would turn me off. My Orion II, and the Eagle do not wear me out, or turn me off.

Jerry, ki4ps

Orion II, and Eagle.

One thing did occur to me. I really like the idea of the built-in tuning scope for RTTY and other digital modes. The "retro" tuning dial on the screen kind of gives of the feeling of being attached to the VFO. (Kind'a like having a car that lets you "feel the road"). Also having a line or two of digital mode text printing out on the screen is pretty nice. It occurred to me that the Orion II has plenty of room inside for additional PC boards if needed and a lot could probably accomplished with software. Not all on the screen at the same time but different screens for different modes. Certain additions could be offered as options to keep the current price point but still allow for expansion. Rather than do the Ford vs Chevy thing, take the good ideas and expand on them.

Just my 2 cents worth.

9286. Orion II screen color poll.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-03-22 14:05:47 UTC
From: Frankie
Topic: 9286 Message: 9286

It looks like 87% of the respondents show they prefer screen color 3 or 4.

I started the poll to show TenTec which colors were most liked. If any changes are made and/or future products are planned, I hope they keep this info in mind and give us more choices similar to these two color themes.

I suppose it is time to close the poll, however I don't see how to close it. Perhaps a moderator can close it for me in a few days?

Thanks,
Frankie

Topic: 2569 Message: 9287

Bonjour George,

I just now saw your post.
As master reset is performed by pushing simultaneously MAIN/RX and ON buttons,
it could be that your button Main/Rx is physically ON (or is sw-scanned as being viewed as such) all the time.
You may want to check this button (by pressing it several times - once ON of course, even while reconfiguring which you have to now).
When the rig is on higher bands (say on 10M or so) and not well matched to my ant, with 100W- or even less- in other words when the chassis carries HF,
the less on many buttons start blinking like a Xmas- tree when keying(CW).
What might be more however is that one has to hit often several times a button several times before being "read" by the system. Annoying during contests. Perhaps for one reason or another
your button ' RX/Main' is read "on" continuously.
But this might bear no relation to your problem other than those buttons seem to be both un-sensitive when pressed, or very sensitive by their LEDs.
I just wonder whether some well ECM measures involving capacitors decoupling put across this lines might help.
73
Pierre,
F3WT

The K-Wood is almost $4000 more than the O2. Does it play $4000 better?
If I was going to ditch the Orion 2 it would be for a Rhode&Schwartz.

Make that a NO.

Enjoying my ORION since 2004, still going strong.
Abandoned all other tried YeaComWood in my shack and traded it for a used ORION II last summer.
These two are here to stay.

In case anyone needs a serious panadapter/waterfall adaption to their shack, look at the Perseus. There is no contest to that one. Superb specs make it a spectrum analyser. Great for MW and SW listening as well.

73 Mark, PA5MW

OH ..wait.. I recently added a TT speaker. Happy with that too.

From: objectiveuser
Topic: 9299 Message: 9299

The subject line says it all.
During the WPX contest this past weekend, one of my Orions spontaneously rebooted on two occasions without me touching anything. There did not appear to be any power glitch, as everything else in the
shack didn't even flicker. Each Orion has a dedicated TenTec
switching power supply. I had replaced the internal battery
a couple of years ago.

Any thoughts?

Terry N4TZ

Terry, this is probably a long shot, but you might want to check the integrity of the power plug on the back of the Orion. They have been known to get loose over time, especially if there is any strain on the plug. Make sure that the connector's pins have a firm contact.

Date: 2013-04-03 22:13:24 UTC
From: wa2isc
Topic: 9302 Message: 9302

Orion 565AT. Comes with internal auto-tuner, all optional roofing filters (1.8 Khz, 500Hz, and 250 Hz), 310 cooling fan, 701 hand mic, manual, and power cord. Also have 302R remote encoder, 963 power supply, 706 Desk mic and matching 307B speaker.

565AT Orion $1900.00
302 Remote encoder $100.00
963 Power supply $125.00
706 Desk Mic $90.00
Speaker $75.00

Package price is $2100.00. I will only sell accessories after radio sells. I prefer local pick up, but will ship at buyers expense. I will deliver within 100 miles of Syracuse, NY. Buyer to split gas.

Radio was at TenTec last year for alignment, V 2 display mod, and new memory battery. All is in excellent condition, with factory boxes. Currently running V 3.025 firmware.

Selling because I no longer contest, and this is too much radio for the casual QSOing that is my part of the hobby today.

Terry,

The A-9 Power Distribution Board is bad... classic symptom. You will need to replace either the board, or if you can do basic soldering and have a Radio Shack close by (I know, RS doesn't have the best caps in the world but it will get you back up and running) then you need to replace the 470 uF caps (3 of them). They are rated at 35 volts but if you can find 50 volt caps, all the better. I think they are C6, C7 and C9, the taller of the 9 Caps on that board.

I think you will find that your problem goes away.

This has nothing to do with the battery and I've had several A9 boards go bad on my 566 and I keep a spare A9 board on hand at all times. If you open the bottom cover the A9 board is right there lookin' at cha.

Terry,

The A-9 Power Distribution Board is bad... classic symptom. You will need to replace either the board, or if you can do basic soldering and have a Radio Shack close by (I know, RS doesn't have the best caps in the world but it will get you back up and running) then you need to replace the 470 uF caps (3 of them). They are rated at 35 volts but if you can find 50 volt caps, all the better. I think they are C6, C7 and C9, the taller of the 9 Caps on that board.

I think you will find that your problem goes away.

This has nothing to do with the battery and I've had several A9 boards go bad on my 566 and I keep a spare A9 board on hand at all times. If you open the bottom cover the A9 board is right there lookin' at cha.

My guess is that it's the battery again. Seems too soon for it to fail,
but you never know.

Hi Terry
Mikes long shot of checking the power connector is a very good place to to start also check the fuse and fuse holder. The fuse contact surfaces can develop a scale on them and become resistive and on voice peaks start drawing to much current. I have had this happen to my 565 and have changed the type of fuse holder.

9309. Filter Center Freq. Adjustment question.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-04 02:25:23 UTC
From: vinster1k
Topic: 9309 Message: 9309

Hello all. I acquired an Orion 565 yesterday and am in the process of setting up and learning this rig. I know there is quite a curve and so have been searching for all the info I can find about the radio.

I did a master reset of the radio wanting to start from scratch. It has the latest firmware installed already and all seems to be working just fine. I did read however that you need to set the center frequency on the 500 and 250 filters after a reset.

I found and read the procedure for doing this and it sounds pretty easy, however the problem I'm having is that I can't find the "steady signal" that they tell say you need in order to accomplish this. I thought that I could use WWV but even that fades in and out so much I can't rely on it to complete the process.

Anyone have a better way or any ideas? Thanks.

73, Vince

Vince, congrats on the new radio! What you should really do is pull the 500 and 250hz filters and sell them. Buy an Inrad #762 600hz filter and install in the 1KHz slot. This is what all the savvy Orion 565 owners have been doing since 2004. See http://users.vnet.net/btippett/inrad_.htm for a full discussion on why.

Date: 2013-04-04 15:13:48 UTC
From: CHRIS
Topic: 9312 Message: 9312

I am experiencing receive audio distortion on both ssb and cw signals. It occurs on both headphones and speaker. I have tried it with filters in or out, auto or selected. I feel like I have been through the menu with a fine tooth comb and cannot find where a setting has changed.
It seems like the 565 has been increasingly flaky, maybe I need a new internal battery as I have seen mentioned many times. For example the b&w screen starts with very little contrast but after a while seems fine.
Any thoughts or suggestions would be appreciated.

Hi,

Regarding the startup contrast challenge I would recommend to investigate (measure) the dc-dc capacitors. In most cases replacing them would solve that particular issue.

On audio distortion there could be several challenges. One is that AGC which has been set to "off" or perhaps with very high decay values. A factory reset would fix that for you as well activate the AGC slow setting. Check if that solves the audio challenge.

If both speaker and headphone confirm the distortion its unlikely the audio finals. Hence it indicates something in firmware. Do you know which firmware is running on the 565? Press and hold menu button to check. Perhaps you have one of those 2.068 versions which is just bad audio quality.

Let us know how it is going and I hope we can find a solution for the challenges as found.

regards, Onno

Ten-tec offers a replacement screen in case the original fails. If you want color screen the 566 would be a better choice. And if you care less about looks and just care about performance the 565 will do great. I think it has the best price / performance ratio in the market.

Hope this helps and best regards, Onno

Thanks for the suggestions.

I am using firmware 3.032

I have checked and rechecked the AGC settings and parameters. Are there new settings for this firmware? Should I do a master reset or is there an AGC reseT?

I have the Hardware noise reduction on, set at 1. I have always used the hardware NR for the bad power line noise I have at this location when the wind blows or rains. It has never had a negative effect before.

Both speaker and headphone exhibit the distortion. And the worst is it is intermittent.
I HATE TO SEND SOMETHING TO BE REPAIRED THAT IS INTERMITTENT!

I will continue to try and track this down until I can recreate it multiple times. Then if it needs a repair that I cannot perform, I'll send it to Ten-Tec.

Until I can I will look for people that have had this problem, and solved it.
Thanks again for any ideas the group might have.

From: John
Topic: 9299 Message: 9317

I believe Mike is on to something, when he suggested you check the power plug on the back of the Orion. In addition, I suggest that you also check the mating connector on the Orion end of your power cord. My Orion 565 is about 8 years old, and when my 565 was at the factory for another problem, I had the factory replace the fixed connector. However, I continued to use the old connector on the end of the power cable.

About two or three weeks ago, my 565 would, or random occasions, reboot while I was transmitting while using SSB. I also noticed that during tune-up the display screen would dim. I could not remember if this dimming had always occurred, or if it had appeared at the same time I started having reboot problems.

After replacing the power cord, connector, and the external power supply, the screen lighting is rock-steady, but I will have to wait for a few weeks to determine with certitude that I have fixed the reboot problem.

Hi Terry,

I have also had this problem with my 565 since it was new in 2003. It does not happen very often, but when it does, it almost always occurs after changing modes or activating some feature (like NR) that hasn't been used in awhile. My power distribution board was replaced by Ten Tec, and this had no effect on the issue. Also, it seems most prone to behaving this way after a firmware update. I always run through the Ram Clear and Master resets a couple of times after a firmware change. The spontaneous reboots seem to occur a few times a week after that, then they slowly diminish to almost never, but still occasionally, if that makes any sense. Weird. I'd be interested to know if you figure it out, because I haven't been able to. I think that the power connector and power distribution ideas are good ones, but that is definitely not what's going on with mine. Good Luck.

Topic: 9311 Message: 9321

Thanks Onno. I don't care about the color screen. The performance of the two are practically the same and the 565 costs less. I'll probably do the mod to add an SDR-IQ for a panadapter.

There's no such thing as hardware NR. NR is purely a dsp function. I assume you mean hardware NB. That could be causing your distortion - the amount of "distortion" would depend on how many strong signals are on the band.

9323. orion 565 power summary

Yahoo group: orion565 (2009 — 2013)

From: pa1ap
Topic: 9323 Message: 9323

As we are gaining field experience on the 565 it might be of use to document the known challengs which surface once in a while. let me start the list;

1- power connector and associated contact. Corrosion of contacts causes poor conduction and especially during high current demand the lcd display contrast changes. Solution: replace the power connector and cable often fixes the issue. The easy test is to reduce the voltage to 12.5 Volt and check if the orion display remains visible. With poor contact the display switches off.

2- lcd display contrast changes a lot when the unit heats up after cold start. Dc-dc power board capacitors need to be replaced. Especially the smaller capacitors need attention when cold to warm challenge occurs.

3- lcd display saturation when unit is running for hours in row. Visible at upper left and right corner and changing contrast does not really help anymore. Top is darker than bottom. Again dc-dc power board but now the now the big capacitors. Also worthwhile to reduce backlight current.

4- irregular power cycling sometimes it just works and sometimes it wont. Again dc-dc board but also check if the cpu battery age. Its seems to work for about 6 years after which weird problems start to kick in. I would suggest to replacd the cpu batter every 6..7 years.

To my knowledge those four capture the main area's and all are pretty easy to fix. Temperature changes will influence especially the first three. Improved cooling will address the sympthoms too but it might be worthwhile to address the root cause.

Hope this helps, regards, Onno

John N1JM,
If you want to add a panadapter, I would highly recommend upgrading the 2nd receiver to the RX-366.
It is the same receiver as in the Jupiter and it has a 9MHz IF port. If you do order it make sure to request the jumper coax to go to from the 9MHz IF port on the RX-366 to the spare jack on the back of the Orion. They will through it in for free.
I call after installing the board and the mail it to me separately, free of charge.
Having the upgraded receiver has totally change how I use the rig. I love it!

From: wa6iaf
Topic: 9299 Message: 9325

My 565 had this rebooting problem. It would immediately reboot when I'd send a dit or dah. Visual inspection of the 2 pins on end of power cord revealed they were oxidized. Also the white plastic of plug had turned a tannish brown on one side from heat. I ended up curing the little problem by soldering pigtail power leads directly to board and bringing cable end out, added a high current in line male socket. Clipped end off original power cord and adding mating female plug to it. Used some sort of military connector pair I had in junque box. No more reboot when sending CW.

Hello

I had similar problem hearing the difference and found a visual program called

Spectrogram (Window Program). The unregistered one will run for 10 minutes before stopping.

Plenty of time to adjust both CF of the filters.

I came across a pdf titled "Using Spectrogram To Measure Filter Response" by

John Grebenkemper, KI6WX that will help with the initial setting of the program.

That will take a minute or two.

By the way, on my 565 the best setting was a zero offset, go figure. hi..

I used my grid dip oscillator. It’s stable and made the adjustment easy.
Zero is great! Mine was +50 Hz for the 600 and −40 Hz for the 300.

Well I came up with another way...not sure if it is ideal or even good. I removed the ant from the Orion so as not to overload it and transmitted a cw tone with my FT-847 set with the power turned down enough to give me a steady S-meter reading on the Orion. This gave me a "steady" signal. My settings ended up being -50 for 500hz and -80 for 250hz.

9331. Mic Impedance on 565

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-06 00:56:23 UTC
From: vinster1k
Topic: 9331 Message: 9331

Newb question #2:

I'm trying to figure out what mic to use on my new 565. I have couple laying around that I could enlist. A Kenwood mc60 or a Shure sm58.

The paragraph on mic wiring doesn't mention impedance. It seems to me they should have gone in to more detail and even given a impedance range to use. Of course I'm never satisfied with the wording or level of explanations in manuals.

In the specs section of the manual it states "Microphone Input Impedance: >10 k-ohms at 1 kHz". This is confusing to me. Are they saying to use a mic with 10k or more impedance?

The mc60 can switch between 500 & 50k. The sm58 is 150 ohms (300 ohms actual).

Could anyone explain this a bit more and tell me what impedance range mic I should be connecting? Thanks.

9332. S-meter reading and RFgain setting.

Yahoo group: orion565 (2009 — 2013)

From: vinster1k
Topic: 9332 Message: 9332

Newb question #3:

OK, so I'm learning to use my new 565 and playing with AF and RF gains. I have noticed that when I lower the RF gain, the S-meter indication rises and just "sits" there, rendering the meter essentially useless.

This is very bizaar to me and for the life of me I can't explain it. I can't give an accurate report without turning the RFgain all the way up at least momentarily. Is this normal behavior and if so, why?

Thanks for any help.

I always use my ears for reports. If one is really trying to get the "best" report, then turn down the gain and read it, but usually I just send what I hear. One of the best ways to listen to your Orion is to turn the volume up and control the level of audio with the rf gain. this lets the DSP work best , or somethin

Chris,

IF you have the AN (auto notch) turned on and a strong signal is present, the audio will distort. The is a BUG that John is and has been working on. When you turn off the AN the distortion goes away. I picked this up right away when I moved from software version 2.064b (I think). As soon as I went to version 3.xxx the distortion began.

Also the distortion is more noticeable coming from the rear audio RCA jack than it is from the front speaker.

Hope that helps.

73 !

Subject: [orion565] Re: 565 Receive distortion

Thanks for the suggestions.

I am using firmware 3.032

I have checked and rechecked the AGC settings and parameters. Are there new settings for this firmware? Should I do a master reset or is there an AGC reseT?

I have the Hardware noise reduction on, set at 1. I have always used the hardware NR for the bad power line noise I have at this location when the wind blows or rains. It has never had a negative effect before.

Both speaker and headphone exhibit the distortion. And the worst is it is intermittent.
I HATE TO SEND SOMETHING TO BE REPAIRED THAT IS INTERMITTENT!

I will continue to try and track this down until I can recreate it multiple times. Then if it needs a repair that I cannot perform, I'll send it to Ten-Tec.

Until I can I will look for people that have had this problem, and solved it.
Thanks again for any ideas the group might have.

9335. Re: S-meter reading and RFgain setting.

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-06 09:25:22 UTC
From: pa1ap
Topic: 9332 Message: 9335

Turning down the RF Gain will indeed move the s meter reading up. It is used as agc activation level indicator. Turn down the rf gain until the s meter indicates S5 and you know the AGC will engage at signals above S5. Signals below S5 would not be normalized by AGC and hence produce less audio presence.

I typically turn RF gain down/up until the s meter is (just) above the undesired signal where undesired could be band noise etc. There is no realistic s-meter reading anyway below that signal level (aka band noise).

The other version is to deactivate AGC by turning down RF gain and turning up AF gain to a fixed value. Than RF gain is used as the replacement audio presence control function. You will loose any sense of visual signal level indication this way.

I spend / waisted a lot of time measuring the difference between the two models and I could not measure a realistic difference. I suggest you try both and see what works best for you.

If you find the AGC to be (to) sharp a little bit of hang time might help to smooth out the short bursts. Decay value would help when you face a very dense / populated channel with a mix of strong and weak stations.

Please note; in recent firmware the default threshold value is set to 5uV... Just check if thats the case and turn it down to lowest value. Its easier to turn down/up the RF Gain as this controls the same AGC function aka agc activation point.

hope this helps. Best regards Onno pa1ap

Yes, unfortunately that's how it works now on the Orion 565. There were older versions of 565 firmware where you retained full scale S-meter reading with reduced RF Gain. What compounds the issue is that the Orion receiver really needs to be used with reduced RF Gain to function properly. The Orion II does have full scale S-meter with reduced RF Gain, a feature that was recently restored in firmware. My understanding is that the Orion 565 lacks the firmware memory capacity to have the feature added back in.

It really is a pity, considering the big beautiful analog S-meter in the Orion, rendered useless by the need to reduce RF Gain. Maybe someday the engineers can do some housekeeping and free up enough memory to restore the feature to the Orion, but not sure that's a realistic hope.

No, they're saying the Orion has a microphone input impedance greater than
10Kohms. Your 150-500 ohm OUTPUT impedance microphones should be usable.

It is quite interesting that the 566 now has that feature, and the 565 does not.

That and the s meter calibration on the 566 is very useful.

I too, run my RF gain at about 50% for a quiet background.

Hi John,

No need for a RX_366 if it is o n l y for that!
As described elsewhere to quite some extend, you may insert at the entrance of either Main or Sub-RX a PMSDR or similar running SW on Flex or the like. You will end-up with 3 receivers (keeping the actual Sub of O1, 1 or even 2 as well with a PMSDR, done by SW) for half the bucks.

Hi Chris,

Meantime (before TT fixes that), did you notice any improvement when reducing RF-gain? Probably you did, if I interpret rightly.
A TT exec showed (on You-tube)how to use it with consistency - that we all tend to keep that 'pot' - which BTW it isn't
on OI or IIs- set to 100%, which often we shouldn't or for sure isn't needed, thus improving IMD-3RD! (Same as output pwr from TXs)

Good!
Thank you!
I remember also of a more involved mod with an "emitter-follower" transistor linking a constant point before the 9mHz IF roofing-filters indeed to the spare on the back.

9347. Orion 565 Mic gain VS band

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-14 12:03:03 UTC
From: va2na77
Topic: 9347 Message: 9347

Hi group,

i have my Orion for 1 year and i do really like this radio. Receiver is just the finest i ever have.

My Orion are in stock form, the only thing i do is to put a thermostatic switch (50 celcius) on the heathink to control the fan.

Only issue i have is the mic gain change from band to band... 15-10 meters need to be higher to have the same output.

Look like the TX IF gain is not the same from higher band...

So anyone have clue about this little problem?

Guillaume

Go to Menu - Other and set "Mic/Pwr Setting" to "Per Band" - this will
allow you to have different settings per band.

9349. Orion 565 locking up

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-14 12:41:48 UTC
From: w5sum
Topic: 9349 Message: 9349

I wonder if any of you have experienced this? yesterday I was setting up for split to work the Samoa group on right now. Suddenly, NO buttons would respond except for the VFO's. I could change frequencies with both, but no other buttons or knobs would work, I couldn't even adjust volume.
I tried the manual reset as called for in the manual but it would not work.
I DO have the latest firmware upgrade.

I powered the rig off and on several times, actually removed the power cable once. Checked my power supply for proper voltate and AC Ripple. All was good.

after about an hour, suddenly, it just came to life without me doing anything.

it has not done it again, but this was scarey.

Any idea's?

Ronnie - W5SUM

Have you tried using a Dummy load ?
When setting your Mic Gain, it is best that you use a Dummy Load to tune your mic gain
(Dummy load = 50 ohms constantly)
so as to have the least amount of "ALC"
Yes, I did say "Least amount in conjunction with ALC"
The letter "L" in ALC stands for "Limiting"

>>> full ALC <<<

Sigh!
Full ALC means IMD/Splatter
Full ALC means the Radio is doing everything it can to 'LIMIT the CURRENT"
Did I mention that the L is for Limiting?
I suggested a"Dummy" load, because it represents a Resonant Antenna on every band, and with very little reflection on the ALC meter, your signal is 100% clean.

According to p20 of the Orion manual, you adjust mic gain so that the ALC LED illuminates on voice peaks. To do so, you need a higher mic gain setting on 12/10M than on the lower bands. That's what the OP was saying. And I'm saying I see the same thing - it's unfortunately normal behavior of the Orion 565 with v3 firmware.

9354. Version 1.373b3 or b5 Firmware

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-14 20:11:11 UTC
From: toby423@...
Topic: 9354 Message: 9354

Is there anyone out there still using version 1 of the Orion firmware?

And what features of version 1 do you like better than version 3?

Toby W4CAK

9355. Re: [orion565] Orion 565 Mic gain VS band

From: Guillaume LArouche
Topic: 9347 Message: 9355

Thank for all your reply,

I always adjust my mic gain using peak reading wattmeter and SM220.. On 160-17 meters, 30 is the correct level for 100w pep, on 12-10 i have to increase mic gain to 50-60 to have 100w pep.

Guillaume VA2NA

Did not have that with my orion 565. One exception I found long time ago was around electro static discharge which rendered my Orion to all kind of funny states. But power cycle fixed that.

It might be worthwhile to replace the battery on the logic board. Its lifetime seems to be around 6 years and most 565's are exceeding that age ;-) Once the battery goes bad the orion boot cycle will get unreliable and resets seem to be incomplete.

best regards, Onno

sounds correct to me. Indeed 12/10 meter band require higher mic gain on my 565 too.

I would not use B3 / b5 but 1372 instead if I would use release 1 code at all.

What did I like;
1- rf notch and noise reduction
2- variable sweep span control
3- rf speech processor

What I did not like;
1- unstable operations
2- rx audio quality (distortion)
3- no visual indication of agc threshold
4- worse display quality

With the latest V3 firmware I have not experienced any unstable operations yet. But V3 misses the items I liked about V1 code. On the other hand the new sub receiver makes the 565 / 566 top of the line contest rig and for this the V3 firmware is needed.

That's my perception at least. Best regards, Onno

I used 1.373b5 up until installing the RX366 subrx. I didn't notice any audio distortion in it. I liked the full range s-meter ("no visual indication of agc threshold") and also the excellent speech processor which isn't as good in v2/v3. Also, I believe the overall gain with headphones was somehow higher in v1 (I could be wrong) - headphone output seems low to me in v3.

But there are far too many improvement in v3 for me to ever go back to v1.

I currently run 1.373b5 on my 565

Tried a V3 version(not the current)last november(?) 2012 and found:
- audio distortion (cannot remember exactly how and when exactly)
- AGC already moves S-meter from 96 onwards and acted way too fast, quickly showing S9+60
- AM BCB reception on 2nd RX was distorted and 'different' with regard to setting BW

Did not like the above and reinstalled 1.373b5
I do CW only and like to listen to AM BCB DX on the medium wave , using 2nd RX.
RF gain is usually set between 70-84 depending on band condx.
Enjoying this lovely rig since 2004.

I currently run V3.029 on my 566

Happy with that.
AGC action is much more course compared to the V1 @565
Using CW only. Mostly on Topband.
Not been able to do any serious DX'ing/contesting during the 8 months I now own this ORION II. This winter offered +10dB noise from several local disturbances. Not much time spent on this rig yet.
Saving money for a new 2nd RX board.
From what I read, the latest version with S-meter behavior changes makes me think to consider upgrading again.

Mark, can you say more on exactly what you observe in the different AGC
action?

I agree that earlier v3 firmware had rx audio issues that were resolved in
the later v3 firmware. And yes, I had to recalibrate my s-meter as has
been discussed on the reflector (quick front panel routine).

Hi Barry,

Oops; by AGC action I meant RF control

Hope this explains the differences I noted:

V1.373b5 @565:
- RF action heard by ear from 86 downwards , slowly to 65. Below that it would gradually act quicker and the S-meter would show the fixed value.

V3.0x (nov '12) @565:
- RF action immedately heard by ear from 96 downwards, S-meter moving, very steep, already at 80 S9+60 and RX completeley deafened

RF gain settings in menu at 1.00 uV
I also leave the audio volume set at some >70% and adjust the RF gain to match the current level of noise/signals on the band.

I found, and still find the fine settings between 65 and 90 max (ORION reception suffers from both noise and sometimes distortion above that RF value setting of 90.

Sorry for my RF gain /AGC mixup!

Mark, thank you for commenting on the V1 firmware. I obtained a used original Orion, and I had one a long time ago. I tried out the latest firmware version and it is improved in some ways, like with the spectrum scope and SAF.

But I missed the blended AGC/RF gain action of the 1.373 b5, and liked the way the s meter works in version 1. I think also the AN is inside the AGC loop in version 1.

Anyway, thanks for your taking time to make a few comments.

How is the AGC/RF gain action in v3 different?

I know the gain distribution and levels have changed a bit, but RF Gain is
still tied to AGC threshold, etc. How is the AGC/RF gain action different?

Hi Barry, It does not seem to act like the threshold is blended with the RF gain. I was just going by what I was hearing. I can turn the RF gain much farther down in version 1 and still get good signal with less noise.

I suppose I just assumed V3 was not configured the same way as V1.

Also, in V1 isn't the AN inside the AGC loop, and V3 it is on the outside?

IN version 1 like the way the S meter does not deflect to the right when the RF gain is turned down.

The RF Gain scales are vastly different between v1 and v3. I doubt there's
an effective difference between versions in how the receiver responds to
signal and noise.

>

Yes, yes - we've discussed that often on both reflectors. Orion 565 missed
out on getting the feature restored. Because the Orion relies on use of
high AF Gain and low RF Gain, the beautiful S meter is rendered virtually
useless without this feature.

I have used for years 1.373b5 as I understand a beta program. I like the audio from the Orion but the Noise Reduction seems useless, is this the case for others and what suggestions may anyone have?

Thanks

The receive audio on my ORION (with the external speaker) is much better than on my ts-590s(with external speaker) & the FTdx-5000D.
The folks from T-T came from ELECTROVOICE & they know a thing or two about audio.

I've never said otherwise, in fact I've never heard a radio that had a better receiver (quiet wise). The "quality" of the audio isn't quite as good as Kenwood (IMHO) however much better than Yaesu and Icom.

I did bench tests years ago when I had the equipment and they proved the same. I've since sold my spectrum analyzer, scope and other pieces (signal generators etc.) so I can't repeat the tests.

Hi all,

I agree with Ray.
Concerning former TS590 (sold) On CW I disliked the sort of waterfall noise with NR2 on , similar to that
of a TS570 which was much quitter , the latter doing DSP on Audio while the former is doing it on (low) IF.
My O1 565 receiving was superb during last week-end JIDX cw contest.
Especially the SAF audio filter occasionally ON at 10Hz , to work weak JA station the second day made the difference. I was amazed..
This sort of rather low "inside cabin noise of cruising jets", which weak CW signals are embedded into seems much less prone to fatigue to me than DSP-noise in said TS590.

Hello Group,
has anyone has an idea ?
iam owner of an orion-I with the latest Firmware 2.064x11 installed also the 500 & 250 Hz Filters.
Since one week have an orion-II, with 600 Hz Filter also the latest Firmware 3.033xa installed.
The S-meter calibration on both has been done as decscribed in the maual. Receiveing now them same Signal with the same Antenna, the Signal strength is much louder on the Orion-1, For Example S5 on the Orion-2,,,S8 on the Orion-1. (In SSB).
The same measure with Preamplifier on or off.

Adjust the AGC does not help really.

Regards, Andreas -DL3FDL-

Is sub receiver connected to same antenna? That could explain a loss in signal if 565 /566 has been configured differently? Regards, Onno

Hi Chris,
If a signal is divided into two different signal paths, each one will be 3 dB lower, or half of a standard S unit, than the original signal unless they are amplified after the divider and before the S meter. Hence, in the Orion series, both 1 and 2, as well as ic7800, and ft9000d series, the signal at the front end of each receiver is cut in half(ie lowered by 3 dB.) I believe that there are amplifiers in the Orion series (both versions) after some of the narrower filters to compensate for the increased losses in the narrower filters (but I could be mistakened!). This could be the reason that the signals do not read 3 dB lower on both S meters.

You can check this through use of the antenna matrix. Just disconnect the sub receiver from the same antenna connection while observing a steady signal.

Thanks for all the helpful explanations from the group. The situation grew worse however. Static distortion was present in the headphones with only headphones (different sets) and power connected. The distortion and static in the headphones had me befuddled so I called Ten Tec.

They had me do a ram clear and master reset and everything returned to normal.

After reading and trying fixes I have developed a greater appreciation for Ten Tec and the capabilities of the Orion.

Next on my list will be to get the RX 366.

Thanks, Chris k4win

I am basing my statements on those made by a friend of Al's, Art Visser (W9ART). He use to go to the Ten-Tec Picnics with Al.

And the answer to one of my last questions about the "policy" of Ten-Tec radios when Al was alive: "If a radio has to come back to Ten-Tec more than 2 times for service, we replace the radio with a brand new one". With that said, I would have a brand new ORION II to replace mine that is 2 years old after having 8 A9 Boards go bad If I weren't a service tech myself, my radio would have gone back to Ten-Tec over 10 times so far (or 5 radios ago).

If there's a bad component repeatedly failing on the A9 board (cap?), why don't you just replace the bad component with a quality component? You've replaced your A9 board eight times?

9385. Orion vs Orion II

Date: 2013-04-20 15:59:57 UTC
From: k9ot
Topic: 7541 Message: 9385

For those of you on here that have/have had both the Orion and the Orion II, which one do you prefer?

Is there enough difference in them to spend the extra $ for the Orion II?
I am thinking difference on CW.

I had an Orion and sold it and now have an Omni VII which I do not think the receiver is as good as the Orion was.

Any comments will be appreciated.

Thanks, 73
Paul K9OT

9386. Interface for RTTY etc

Yahoo group: orion565 (2009 — 2013)

howdy gents
I've had my 565 for two weeks and I love it

I want to try rtty, something I have never done.

can anyone recommend a tried and proven interface and software?

thanks in advance

Ronnie - w5SUM

9387. Serial port baud rate / other setting needed

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-21 03:48:34 UTC
From: w5xj2011
Topic: 9387 Message: 9387

What do you suggest running as far as baud rate and other settings to get the 565 to talk to HRD, N1MM, etc?

Thanks & 73 de W5XJ

That's an easy one, Ronnie...!

Ten Tec has an interface card, which is in-line with an inter-connecting USB cable. The model number is 712. I think it sells for something like $35 or $40, but haven't checked lately. All you need is to connect the cable between your (Windows) PC or laptop, and the Orion. If you use a Mac or some version of Windows prior to Windows 7, you should probably call Ten Tec to be sure what will work for you. I use Windows 7.

For software, I use FLDigi, which I believe is still free to download from the Internet. There are other software packages, but FLDigi covers a wide variety of digital modes and is easy to use. For the digital modes, I mainly use PSK-31, and to a lesser extent, RTTY. Both work flawlessly in this configuration. The only problems I have had (and they have been very few...) have been a result of "pilot error".

When in doubt about any of the above, either call TT or find a digital modes expert in your area that can show you the ropes.

Hope this helps -

73,

Jim, K8OZ
Albuquerque

9390. Re: Interface for RTTY etc [Line Level]

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-21 05:01:41 UTC
From: storygene
Topic: 9386 Message: 9390

Since we are on this subject of RTTY, this reminds me to ask about the line level output on the AUX port. It tracks ith the position of the front panel Gain control instead of being a fixed level. It does this with V3 firmware and I think V2. I think in V1 there was a menu item that let you set the level from there.

Comments? I do not like the way it works presently unless someone can tell me if I am doing something wrong.

9392. LINE OUT jack problem on Orion II?

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-21 15:05:55 UTC
From: kc2qma
Topic: 9392 Message: 9392

I decided the other day to use the line out jack on my Orion II but I get no audio from the line out? I checked the line out source and level settings on the other menu but just can't get any audio out?
I do get audio from the AUX I/O jack but not the line out?
Any ideas?

OK so I found something interesting today. I have a signalink USB connected to the AUX I/O jack and when I unplug it then the line out works? I thought it might be an impedance mismatch but it's not. I don't know if anyone else uses a Signalink USB but I would like to know if you have the same problem.

Same problem as described above, the isolation transformed goes into
saturation... put 470nF as a DC block on the Line-Out signal, and all be
well, trust me!

From: branton_thomas
Topic: 9401 Message: 9401

Good morning everyone,

Well I narrowed it down to the K3/100 and the Orion II. I thought I had bought a K3/100 but a close lightning strike a few days ago cooked a couple of major boards so the seller said he was going to fix and keep it. Maybe it was a sign!!

If you have a mint or near mint Orion II that needs a new home please contact me.

Thanks so much,

Tom

Sure -- Conditions were very bad -- Station I was calling was VU2SWS on phone (15m) -- When I turned on SAF I was able to copy her with ease
with preamp on-- I was using the TT speaker & DX ENGINEERING HEX (the finest) -- FTdx 5000 was deaf (I read in their reflector that it has issues with weak signals). Hope this helps -- Ray

9410. Re: Orion receive audio

Yahoo group: orion565 (2009 — 2013)
Date: 2013-04-30 13:22:32 UTC
From: ray.higgins25
Topic: 9399 Message: 9410

The Orion's receiver is very strong (I almost never use the the preamp) & is the best of any rig I've used (IC-7700,FTdx-5000 & TS-590). The way SAF works is that it increases signals fer SPECIFIC
freq's (around 300-700 hz) not the whole band . The fact that Ten Tec
is still upgrading the firmware on a rig that is 10 years old says a
a lot.

The reason fer SAF & why it is used on lower part of the receive audio
I'm not going to get in to . Remember when my FTdx5000 heard nothing the ORION pulled out weak signals. Not bad fer a 10 year old design !

Lets be positive; it is a GREAT rig & any upgrades are just that (to improve on an all ready state of the art transceiver).

Ray

I'm enjoying a new Kenwood TS-990S...but the Orion II receiver is equal and the SAF works better than the Kenwood's APF equivalent...

The O2 in my shack isn't going anywhere soon.

My view & perception is that the usage of preamp makes sense for the higher bands when band noise is acceptable low. I don't think it helps to amplify band noise more than internal noise contribution.

SAF works on AF level and works like a passband af filter. Indeed with weaker stations it helps to lift the voice out of the noise especially when the station has a flat or shallow audio presence, for example a female voice is hard to detect without SAF and with SAF you can emphasize the lower frequencies a bit more and hence improve audio presence. The RX equalizer could help as well however its either low or high pass AF filter and it would emphasize more audio spectrum than needed... I guess the SAF 300Hz passband is just enough to raise audio presence without raising all other noise.

On high AF, low RF OR normal AF, normal RF and such like; I have not found any evidence the signal to noise ratio changes, nor that audio presence changes, despite all testing I have conducted. Audio presence might sound different because there is no AGC action but that's all. I am not buying into the ADC range statements since the signal to noise ratio isn't changing based on deactivating AGC while the opposite is actually true for audio presence. In some previous firmware versions the AGC did cause distortion and hence it was worthwhile avoiding AGC. Not anymore.

I recently changed my antenna setup and I can now copy VK on 20m almost every morning. Pretty cool and it also gives me the chance to tinker with the settings for weak(er) stations. So far all I need to do is reduce band noise and at times apply SAF to copy the conversations depending on audio presence. Stations sinking into the band noise do not get better when I switch on the preamp nor does it get better when turning up AF and turning down RF. However it is certainly true that stations which are stronger than band noise will sound better when ensuring the AGC does not normalize the band noise. Either through just RF gain control or AF / RF gain control provide same results at my end.

Anyway, my perception and just my perception. Reality might be different :-)

best regards, Onno

p.s. just enjoy the Orion and be happy you can choose how to operate your rig. RF and audio tinkering allowed :-)

Actuall it was Barry N1EU that told ME that I SHOULD keep my PREAMP on all the time after my post 9410. It was his post of 9411 & fer some reason has vanished into thin air . Hmmmm .

Now I understand the confusion, with out "9411" all my posts make no sense .

Sri everybody -- I still don't understand why 9411 was pulled .

I have never told anyone what they SHOULD when operating their ORION's

Tnx Ray

9422. Ten Tec's 9mhz IF Mod

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-04 01:59:41 UTC
From: toby423@...
Topic: 9422 Message: 9422

I am contemplating having Ten Tec do their version of the IF mod on an original Orion. This, of course, is for the purpose of installing a panadapter of some kind. I don't have the new sub-receiver.

Has anyone had Ten Tec do this mod, and how did it work out for you?

I understand the signal is picked up after the DSP, and that a buffer amp would be required externally to the Orion.

I know about the mod which involves istalling an amp buffer inside the rig, but not sure where the signal is picked up from for this version of the mod.

Any help or comment would be appreciated.

All,

My 565 (s/n 10C10284) has now begun to show some of the 'classic' documented signs of A9 (81936) board degradation.... ie the replacement screen having a 'washed out' (flickering, almost black on white) bottom 2/3 of the blue on white display area along with random full-screen flickering horizontal white lines when cold, for the first 1/4 to 1/2 hour+ after initial power-on. After warm-up things seem normal.

1) I have read about replacing the 3 - 470uf/35v caps and the 3 - 100uf/35v caps with Low ESR, higher DCWV (50V) replacements..... 2) I also see references to TT having upgrading the A9 Board somewhere over the years.....

?Have there been any TT changes from the original TT circuit design? (Not just component tolerance vallues, but actual circuit diagram/wiring changes over the past 10 years for the A9?)

?While I see notes about upgrading/replacing the 470uf/100uf caps.... what about the 10uf caps?

?OR how about a 'wholesale' replacement of the A9 being the most prudent course?

Thanks, 73,

Ben - WB2RHM

Ben,

I don't know how much an A9 board would cost from TT, but whatever the cost, replacing the (3) 470uF caps has got to be the most inexpensive way to go. As far as changing any of the other caps I would have to say that they haven't failed nor is there a record of them failing.

Replacing the caps is an easy job and only takes a few minutes from start to finish.

There hasn't been any mods to that board that I know of with the exception of TT using higher voltage caps in the newer released versions (and I'm not positive about that).

You might want to check message 9323. This in addition to Sams response.

When facing cold start issues the smaller capacitors might be faulty. I have several cases where replacing the smaller ones fixed the cold start problem. Since you are taking out the dc -dc board its a small effort to replace them too.

One warning: before taking out the capacitors make a mark on the pcb to indicate polarity.... this because not all capacitors will be mounted with negative to ground.

Best regards, Onno

Hi Ben.

There are many issues with the A9 and I tracked down an additional cold-start problem and described it in Message 8462. This involved some of the smaller caps.

It took me several minutes to get the display up to full density and this solved the problem.

Ben and Group,
I paid $65.00 Plus S&H for a new A9 Board from Ten Tec. I saved the shipping and handling by driving to Ten Tec and picking the board up. Still had to pay the Tennessee sales tax (highest in the nation) plus the gas. I could have bought the parts from Digi-Key, paid S&H and the Tennessee tax. I wouldn't have seen the parts for a week.

Next time I order parts I will pick up some caps and fix this old board and offer it to the group.

All in all, the drive to Ten Tec is a pleasant one. I visited with the folks and stopped on the way home for a home made ice-cream. Kind of a wash!

Sam, Rick, Onno, Paul, lurkers,

I have removed all of the electrolytic caps from the A9 board. After reading and re-reading the spec sheet of the LT1054, and looking at the schematic of the A9 board, I ordered 50V extra low ESR caps from Mouser to replace all electrolytics.

Also after reading the LT1054 spec, I am going to use 22uf 50V low ESR caps to replace all three of the 10uf 35V electrolytic caps on A9. AND I am going to change the 100uf 35V C2 electrolytic to a 220uf 50V low ESR electrolytic (to maintain the 1/10 ratio for C2/C4 as mentioned in the spec, and also match up the values of C3 and C4 to 22uf.)

The parts should arrive from Mouser on Friday, and I hope to get them installed in time for the VOLTA RTTY contest this weekend.

Thank you for all your advice, I will let you know what occurs sometime early next week, after the contest.

73,

Ben - WB2RHM

Interesting changes Ben. Please let us know how it goes. I suggest you meassure the voltages, especially the negative lcd voltage, prior to connecting it to the lcd. Not sure if the capacitor change influences the output voltage somehow. Best regards, Onno

9431. Sub receiver, VFO B

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-07 22:27:17 UTC
From: donkn5i
Topic: 9431 Message: 9431

A couple of weeks after I did the latest software upgrade I discovered my Sub receiver, VFO B no longer works. I downloaded and reinstalled and same thing. Anyone else have any suggestions. I only get static when moving the VFO V knob. Strongest signal on the scope only gets white noise. Don't hardly ever use VFO B except for split and ocasional WWV. Wonder how much it will cost to fix this?

Have you done the reboots Don? I've had some funny things happen too in the past just not currently

Is it no audio in SPLIT or just none in simplex?

If no audio in split make sure your VFO A & VFO B buttons are lit in the right order

John

Donald,

Did you by any chance select the 466 receiver if I remember the number correctly? Do a master reset and select the correct option. I seem to remember it as a yes/no option. If it is the original sub receiver, the answer would be "no."

73,

John

Even if you have already performed them, try doing both the RAM CLEAR and MASTER RESET procedures. Do the RAM CLEAR first, then immediately do the MASTER RESET. You will loose any custom menu settings, but sometimes the procedures will bring the subreceiver back to life. I've had the exact same issue with both the Orion and Orion 2; doing both reset procedures fixed them. I also started recording my menu settings on paper so I could get them back to where they were without too much fuss.

Good Luck!

73,
Luther N4UW

No Audio period. Just white noise. However transmit is ok.

I'm confused! Does you Orion II have the new sub receiver? Also, where did you say no to the 566?

9440. Re: [orion565] Re: A9 Board..... summary of fixes and mods.....

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-08 18:14:28 UTC
From: catfishtwo@...
Topic: 9423 Message: 9440

Another trick I found along the same lines is when soldering wires to a mini din plug (or others) , cut a potato flat , top and bottom, and stick the end of the din plug into the potato. this holds the plug firmly, and also acts as a heat sink so when you solder in one wire , the one next to it does not come un soldered. tom N6AJR

In a message dated 5/8/2013 10:58:27 A.M. Pacific Daylight Time, wb2rhm@... writes:

Onno, et al,

I will measure the no-load voltages at the JP1 connector, and the +5V output pins, and might find a way to record them, when my new 50WVDC Low ESR capacitors arrive and get installed.

FWIW From the LT1054 spec, the Cin and Cout (C4/C2) capacitor values do not affect the output voltage level produced. However, since you are using C4 and C3 as part of a voltage doubler, C4 and C3 should be about equal. The value of C2 has a direct effect on the output voltage ripple, changing it to 220uf should decrease any p-p ripple.

I always wondered why the C8 100uf cap on the +5V line only had a 6.3WVDC rating..... cost? size?

FWIW(2) - FYI - Since I did not really care about the condition of the 'original' caps on the A9 board, I did a distructive removal to make the clearing of the PC board holes easier and to prevent overheating the PC board when trying to remove the old caps (which are large heat sinks when trying to unsolder them from below). This is an old 'US Navy' electronics repair depot trick. To remove the 'dead/old' electrolytic caps , I grip the body of the cap with pliers, or my fingers, and bend the body of the cap all the over to PC board. With caps like the ones on the A9 board, the internal connections of the leads inside the body of the cap break.... allowing you to pull the entire cap body off of the two moounting leads. This leave just two 'wires' connected to/through the pc board. These are completely easy to heat and remove from the pc board without damaging the board from excess heating. Then I heat one side of the PC board hole with a pointed soldering iron tip at the
hole and use a round (not flat) wooden toothpick to push through the melted solder from the other side of the PC board. The solder does not stick to the wooden toothpick, and the toothpick displaces all the solder from the hole. So, the PC hole is left open and solder free, and ready for the new component to be inserted.

73,

Ben - WB2RHM

PS Onno, are you going to any of the Windmills 'on-the-air' this weekend?

From: WB2RHM
Topic: 9423 Message: 9441

Onno, et al,

I will measure the no-load voltages at the JP1 connector, and also the +5V output
pins, I might also find a way to record them.

FWIW From the LT1054 spec, the Cin and Cout capacitor (C4/C2 on A9 schematic) values do not
affect the output voltage level produced.

However, since you are using C4 and C3 as part of a voltage doubler, C4 and C3 should be about equal. The value of C2 has a direct effect on the output voltage ripple, changing it to 220uf should decrease any p-p output ripple.

???? I always wondered why the C8 - 100uf cap on the +5V line only had a 6.3WVDC rating..... cost? size???

FWIW(2) - TIP - Since I did not really care about the condition of the 'original' caps on the A9 board, I did a 'distructive removal' .... to enable the cleaning of the PC board holes easier, and to also prevent overheating the PC board, from trying to remove the old caps (which really are just large heat sinks, when trying to
unsolder them from below). This is an old 'US Navy electronics repair depot' trick. To remove the 'dead/old' electrolytic caps , Without heating, I grip the body of the cap with pliers, or my fingers, and bend the body of the cap over to the PC board. Electrolytic caps, like the ones on the A9 board, the internal connection of the leads inside the body of the cap break clean.... allowing you to pull the entire capacitor body off of the remaining two moounting leads. This action leaves only two 'wires' connected to&through the pc board. They are completely easy to heat, and remove, from the pc board without damaging the PC board from excess heating. Then, I heat one side of each PC board hole with a pointed soldering iron tip centered on the hole, and using a round (not flat) wooden toothpick, I push through the melted solder from the opposite side of the PC board. The solder does not stick to the wooden toothpick, and the toothpick body displaces all the excess solder from inside the PC hole. So, the PC hole is left open and solder free, and ready for the new component to be inserted.

73,

Ben - WB2RHM

PS Onno, are you going to any of the Windmills 'on-the-air' this weekend?

9442. Transverter with Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-08 19:09:37 UTC
From: nr0t_mn
Topic: 9442 Message: 9442

I have an Orion 565 and a Down East Microwave 10 Mtr/2 Mtr transverter.
I have turned on the Transverter option in the TX Menu.
It works great with one exception.

The Orion only will go to 29.710 MHz which means that I can only operate from 144.000 to 145.710 MHz. The problem is there is at least one satellite in the 145.900 - 146.000 frequency range.
I assume that this is an Orion limitation which has no work-around.
But before giving up on it I thought I would ask here.

Is there any way to extend the Ten-Tec to cover up to 30 Mhz?

Tnx es 73 de
Rolf NR0T

Rolf, try operating your Orion via a software program such as Ham Radio Deluxe or N4PY. I use HRD to extend tx on my Orion to work on some MARS frequencies. It might work for you too.

Rolf,

Butch hit the nail right on the head! I use N4PY software with my Orion II and the Elecraft XV series of transverters for 50 thru 432 MHz. and using the N4PY software lets me use the full 2 MHz. in each band.

Hi Donald,
I'd start out by doing a master reset. IF THAT DOESN'T FIX IT, I WOULD THEN do a battery reset. If that doesn't fix it, I would reinstall the older version of the firmware that did work. If that fixes it, I would then install the new version of the firmware. Questions? 406=366=3896. 73 es Gud Luck!! Kirby, K7EC

Subject: [orion565] Sub receiver, VFO B

A couple of weeks after I did the latest software upgrade I discovered my Sub receiver, VFO B no longer works. I downloaded and reinstalled and same thing. Anyone else have any suggestions. I only get static when moving the VFO V knob. Strongest signal on the scope only gets white noise. Don't hardly ever use VFO B except for split and ocasional WWV. Wonder how much it will cost to fix this?

I though this problem got fixed after a hard reset, and deselecting the RX366 sub receiver on setup.

Also, the scope on the sub receiver is only the bar scope, but then that might be the one you are talking about.

Orion 2 with option SSB filter, 963 power supply.
Also have 707, 708, 709 desk mics.
Latest firmware, box and manual.
$2800.00 for all
Will meet or deliver reasonable distance from Kingsport, Tn

Welcome Jim to the group.

I have had my ORION II for about 4 years. What do you need to know ?
I have tons of good stuff to say about the O2 and just a few negative things like their power distribution board, look and feel of the control knobs, lack of a 9khz tap in on the back, no USB port for HRD control, etc...

Any questions, just ask.

73 !

I'm assuming that another solution without the software would be to see if you could get the MARS mod for the Orion II. Then you would be able to transmit on a wider range.

At any rate, if you use the N4PY software, you won't be disappointed. Carl does a nice job with the software.

Good luck & 73,
Bill/K1FPV

All,

Here are my results.....

All the new electrolytic, A9 board, caps arrived from Mouser, total cost less than $10US including USPS Priority shipping. I had no problems installing all of the 'new' 50WVDC Panasonic LowESR caps into the A9 board. However, two of the 470uf caps did not sit perfectly flat to the A9 board because they are an RCH (:)) larger in diameter than space allows.... No problem, if you tilt them slightly away from each other, this allows for easy placement and soldering.

To test before installing A9 into the 565, I used an external regulsted power supply to supply +13.8VDC to the A9 board input pins. When measured, the +5V Output pins provided +5.1VDC and there was NO detectable ripple on the +5V A9 pins. The -20.5VDC A9 JP1 pins, measured on my DVM, showed -20.4VDC, with a 'flat line' ripple displayed on my 35MHZ Elenco O'Scope.

Based on the isolated A9 test, I installed the A9 into my 565.

WOW! From power-on, after the system initialization, the Blue on White or the White on Blue displays were CRISP, and the characters appear to be SHARPER, with no contrast change from Power-on to +15 Hours of 100% duty cycle..... (the duration of the Volta RTTY contest last weekend). Some of this could be due to how OLD my 565 had aged over the past 10 years..... BUT it is like having a new display in a new 565.

However, nothing has changed about the angle-of-view flicker for the replacement Blue display..... the clearest viewing is restricted to a narrow angle +/- off of straight-on line of sight. But, when you are viewing it almost 'straight-on', it is perfect White-on-blue or Blue-on-white..... The inherent 'flicker' of the replacement Blue display is still there..... and that is the next thing to 'fix'. But any warm-up fading/horizontal lines are gone.

$10 bucks..... you cannot miss on this update if your display has aged.

73,

Ben - WB2RHM

9455. Re: A9 Board..... Part numbers for 50WVDC Low-ESR 108C Caps (Mouser)

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-14 13:30:09 UTC
From: WB2RHM
Topic: 9423 Message: 9455

All,

Here are the Mouser part numbers for the Panasonic, Low-ESR, 50WVDC,
108C electrolytic caps I needed to repopulate all the caps on my 565 A9
board:

Mouser Part No.
Manufacturer Part No.
Description

667-EEU-FR1H221
MFG Part No:EEU-FR1H221
Panasonic Aluminum Electrolytic Capacitors - Leaded 220uf 50WVDC 108C
1 -C2 $0.39ea

667-EEU-FR1H220
MFG Part No:EEU-FR1H220
Panasonic Aluminum Electrolytic Capacitors - Leaded 22uf 50WVDC 108C
3 -C3,C4,C5 $0.09ea

667-EEU-FR1H101
MFG Part No:EEU-FR1H101
Panasonic Aluminum Electrolytic Capacitors - Leaded 100uf 50WVDC 108C
2 -C1,C8 $0.22ea

667-EEU-FR1H471
MFG Part No:EEU-FR1H471
Panasonic Aluminum Electrolytic Capacitors - Leaded 470uf 50WVDC 108C
3 -C6,C7,C9 $0.69ea

USPS Priority Mail $4.99

73,

Ben - WB2RHM

excellent and thank you so much for sharing this information with the group. Yet another improvement to get the A9 board under control. Best regards, Onno

9457. Re: A9 Board..... Part numbers for 50WVDC Low-ESR 108C Caps (Mouser)

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-14 14:33:35 UTC
From: storygene
Topic: 9423 Message: 9457

Thanks for the excellent information Ben.

I am about to replace my 565 Orion LCD and was contemplating what capacitors, and where I would acquire them to refresh my A9 board. After reading your message trail, I placed an order this morning with MOUSER for the ones you listed, along with some extras. I always add a few spares for replacements, or "other" projects that might need them.

Thanks,

Gene / K7TXO

Oh! I didn't realize that. Well, we learn something every day! Guess the software solution is the only way to get around it then.

Thanks Ben for the info! I've had to replace the caps on my Orion II A9 board a couple times already. I'll keep this in mind for the next repair should it need to be done.

73,
Bill/K1FPV

YES Rick, I was referring to your mod I recognized.
Sri for being late to confirm..
Meanwhile I got my N4PY SW currently working though it, getting started.
Second stage shall be inserting my PMSDR, as said earlier. An alternative
done and posted by Paul K3SF.
Hope it will not be too tedious!
Thank you.

Hi Paul,
Seen your pics of your mod file! Great!
Question: do you run all this concurrently on a same PC , that is: O1 w.N4PY, SDR-IQ w. PowerSDR-iq (I use a vers. from SV1EIA), CW-skimmer, N2MM and may be even more?
Thank you.

Topic: 9442 Message: 9462

I could never understand T*T's thinking on this. Why put "safety stops" at the beginning and ending of each band ? Almost as if they are policing the bands.

Don't get me wrong, I could give a rats ass one way or the other, but all the other radios that I've owned would transmit way out of band. Some would even transmit in the children's band. (again, I've never transmitted out of band, just pointing this out for the record)

Back when COMMERCIAL software programmed radios (not SDR) first came out, ie. Motorola, Maxon, Fujitsu Ten and a few others, it was easy to get into the programming code and once you figured out their secrets (start and stop bits, hexadecimal or binary, delimiters, etc) you could pretty much over-ride their limits. In fact, FujiTen communications wrote their mass-distributed programming software in dBase. Once I cracked that, I wrote an .EXE program that would go above and below the specs (so that amateur operators could also use these as mobiles / portables). Fuji liked the program so much they bought the rights and code from me, lol. (no, I haven't analyzed T*T's coding... yet)

My point, there is no excuse for an ORION radio not to be able to transmit in the MARS frequency range "out of the box". You shouldn't need to buy third party software to do this. If someone is stupid enough to transmit there without belonging to the MARS organization then they deserve the book throw at them, but it's not T*T's job to police this by putting in Start and Stop band limits.

73 !

Sam
K3SAM

ps: I understand going past the limits will reduce the output, that's not the topic here.

hello pierre

my basic setup is an Imac computer running osx and a Vmware with XP
with this setup i can run various configurations

Both config #1 and #2 are OSX native, no VMXP required

config #1 - simple

i use maclogger dx(mldx) for logging and basic rig control(freq and mode and split and of course logging, cluster monitoring) of the orion......rig control is not as complete as N4PY s/w but good enough for me.

Config #2- SDR_IQ as third receiver native OSX

includes config #1 plus running SdrDX for operations of the SDR-IQ as the third receiver... this setup allows for multiple features , like seeing the pileup and finding a clear spot, or listening/looking on other bands for openings while in a pileup on another band.. i do use a headset where i listen to main receiver in left ear, subreceiver in right ear and the sdr-iq on speaker....

Config #3 - SDR_IQ setup in VMXP with CWSkimmer

Includes config #1 plus VMXP up and running CW skimmer with the SDR-IQ
and with mldx setup to look at cwskimmer local cluster...looking for band openings on one band while i tune across other bands...also used to access dx operator style who is working a pileup...much easier to 'see' cw pileup and all the calls and figure out is the dx station is tuning up, tuning down or some random walk or sits on one freq for a while...from there i can plan a strategy on where to call...

Config #4 - SDR_IQ setup in VMXP with Spectravue

This does not include Config#1 setup...this setup allows for freq/mode tracking of either the orion or the SDR_IQ with a panadapter type display...i dont use this configuration often

with SDR_IQ setup as 3rd receiver only limited by s/w and imagination

Well, maybe that is something that Ten-Tec will be able to rectify by something as simple as a firmware update.

I've got a couple of radios that are already modified for MARS use. I used to belong to Navy MARS but recently applied to Air Force MARS and apparently, the Air Force isn't responding to any new applications. I suspect that MARS may be on the way out with Homeland Security kinda ruling the roost now.

The only reason why I'd like to have MARS ability is that even though I don't often use the upper 300 kHz. of the 2 or 1¾ meters or 70 cm, I prefer using the rig manually(10 Meter IF). The N4PY software gets me there with my Ten-Tec rigs, even though I prefer operating the rig with transverters manually, not via software.

I occasionally use the other rigs to drive my transverters so that I can use all of the 2 MHz. segments.

It may be possible too Sam that Ten-Tec was asked to do it the way that they do by the FCC for type acceptance. Only Ten-Tec can tell us that.

The last two days I have had an intermittent problem with my Orion 565.
I have no receive audio or just white noise. When this happens no
transmit output over 1 watt. Screen shows proper tuning and mode
selections, but you can't hear anything or only hear white noise.

Any ideas before I send it in?

I assume power off/ on does not fix the issue? Perhaps the cpu battery is end of life.

The usual master reset and normal reset would be a first step. Also which firmware is loaded into 565? While 565 is operational press and hold the menu button until the screen shows the firmware. Any troubles when upgrading the firmware? Did you disable ignore stop on error during upgrade?

Best regards, Onno

Onno -

The firmware is version 3.032 that has been running fine for a few
months. No problem with the firmware.

Did several master resets and battery failure resets.

Put in new battery about 2 months ago.

Thanks in advance,

John, with that 1 watt xmit output, can you hear the Orion tx signal on the correct freq on your K3 and does it sound clean?

No rx output from either main or sub receiver? Can you feed it a strong local signal (key the K3) and hear that through the Orion rx?

Do you have an oscilloscope and can you read schematics or do you prefer to send to the factory for service? There is a schematic index at http://www.tentecwiki.org/doku.php?id=565schemindex

Barry -

No scope. I've fixed easy things (had no PTT on fromnt panel mic connection) but looking through schematics for these issues is more than I can bite off. Sending it back to Ten Tec is becoming more likely.

Hi Paul,
When you use config #3, and using VMXP for cw skimmer, are you using MLDX to log and control the O1? The SDR-IQ with separate antenna, is connected to a Mac via USB? SDR attached to some rf sensing device for protection during transmit?

Sorry for the questions that might have a very obvious answer that I don't see.

And I wouldn't need the new 366 internal receiver?

Thanks, Chris K4WIN

For Sale -

Model 219 - 250hz CW filter for Omni-V, Omni-VI, Orion 1, etc.

Specifications -

Center Frequency 9.000750
6 dB BW, Hz 250
Shape Factor, 6/60 dB 2.4:1
Insertion Loss, dB 10.0
Ultimate Rejection, dB 85+
Z in & out, Ohms 200
Number of Poles 6

$55 including postage. Contact hjohnc at gmail dot com.

9473. Orion 565 no audio or transmit - FIXED

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-17 13:05:06 UTC
From: John Huffman
Topic: 9473 Message: 9473

It appears that I have fixed the no audio or transmit problem. At least for the last 12 hours or so. I will tell the tale in hopes it will help someone else.

I took off the front panel and undid the connectors and cables. I used a small brush to coat the pins with Deoxit. Plugged and unplugged them ten times (thanks Carl N4PY). No joy.

I started on the boards. I unscrew the board, coat the pins of the connector that plugs into the back plane, exercise them 10 times, and screw the board back in.

I started with A9 since I suspected it was a power issue. No joy there.

I next went to the board next to A9 on the bottom towards the front. No joy. Flipped the radio over.

Did the front left board (IF?). No joy.

Did the right front board (under the speaker). It's alive!!!

The problem had progressed by that time so that it only took a short while for the problem to appear if it was not already there when you first turn it on. Thus, I could test after each board cleaning.

As usual with my troubleshooting, I don't know what that board does or why it caused the problem. But, I did the things I could that were within my abilities and many times that works. Anyone know what that board does?????

I'm just hoping that I won't have to take all this back if the problem reappears. If it does, my troubleshooting will be limited the boxing it up and sending it to Ten Tec.

Many thanks for the interest and suggestions from the folks here. Without that support I would probably have just boxed it up to begin with.

Topic: 9339 Message: 9474

hi chris

My mod is NOT a 9mhz mode .. but is the antenna mod to spare rca..

FYI
My mod shares the orion's subreceiver antenna and brings it out to the spare rca jack in the back of the orion.. I chose the spare receiver antenna so as to minimize impact on the main receiver and to use the internal antenna switching of the Orion.

Now to your questions
Question #1
When you use config #3, and using VMXP for cw skimmer, are you using MLDX to log and control the O1?

short answer...yes...

long answer
Yes...that way i can use the cluster/spot panel of mldx that is now connected to the cwskimmer cluster of the sdr-iq..click on the spot the sdr-iq/cwskimmer generates and the orion goes there..

great for search and pounce in cw contest or when the bands are active

also

cwskimmer can be searching across 10m cw while i search across 12m manually....or any other band mixture..this has help maximize my radio facetime

question #2
The SDR-IQ with separate antenna, is connected to a Mac via USB?

NO...The Sdr-iq is connected thru the Orion to the antenna system so the orion needs to be ON...

Yes...the sdr_iq is connected directly to Mac via usb and not thru a usb hub...
i have had issues using the SDR-IQ thru a usb hub...mostly a power issue for it and most powered usb hub have generated lotta rf noise due to cheap switching powersupply wall warts..

also need to install the ftdi driver for the sdr-iq to be recognized on the usb port

Question #3
SDR attached to some rf sensing device for protection during transmit?

Sort of... i use passive device and not a rf sensed switch as antenna switching is done by the orion...
.
I use an ICE model 196 RF limiter as the passive device to limit rf sensed by the

SDR-IQ...it keeps it from being overloaded....even when running the amp here
.

right now i am using a single coax from the remote antenna relay switch box connected to the antenna farm
BUT
Future updates to the shack will be a topten sixpac to bring back two coax lines from antenna farm so i can use the ANT1 and ANT1 and RX ANT ports of the orion and the orion's built-in antenna switch matrix
this will allow for a wide range of antenna configurations to be used by all the receivers of the orion and the sdr-iq...this will allow the SDR-IQ to be using a different antenna than the orion and since the sixpac has interlock switching i wont accidentally select the same antenna as the orion and transmit into the sdr-iq

regarding 'needing' the rx366 receiver...most hams always need the latest and greats...my orion II does have the rx366 with all filters...plan there is for better diversity reception when the sixpac goes on line..

hope i answered you questions well enough

Hi Paul,

Let me thank you for your direct answer to me a couple of days ago. But also for the one to Chris (K4WIN) with your additional infos in there.
Very interesting. I can follow your explanations. All the more so I use OSX es MLDX as well (on a MacMini).
For latter to control your O1 you do use yr said USB/serial adapter , do you?
Thank you again.

9478. New blue LCD seems to work better

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-18 19:37:06 UTC
From: Stan
Topic: 9478 Message: 9478

I have had quite an odyssey getting a new LCD in the Orion. I ordered one, installed it, and got a blank, backlit screen. Called and discussed it with Paul, who sent a second LCD. Still a blank, backlit screen. At this point I was afraid there might be a problem with my logic board, so I sent the Orion and the two LCDs to Sevierville. It turned out that both of the LCDs they sent were defective. They installed another one and all is fine.

I did notice when I was installing the new ones that they now have slightly different part number from the one shown in Ohno's photos of his installation. And, the good news is that the white background now seems to work without the flicker several people have mentioned. I have uploaded photos of the new LCD to the Orion White Lines album on the Yahoo groups site. Unfortunately my camera is making the blue look more washed out than it is, but I hope you can see that the new LCD looks good with both the blue background and the white background.

Sound like a scary experience and what are the odds to have two defective displays... Good news it got resolved and even better that the flicker isn't noticeable anymore!

Enjoy your new display. Best regards, Onno

Chas,

I can't find the original invoice for just the LCD, which I think I returned to TT with the defective LCDs. The total labor cost for a new LCD and a new battery was $159, so the LCD alone must be something like $145-150.

Chas,

The VFO encoder shaft length is three quarters of an inch long out the end of the encoder. The total effective lenght past the nut (which rests on the inside of the front panel) is one inch long.

Topic: 9486 Message: 9487

Looking at the manual says the rear key jack is wired in parallel with the front. I use two keys plugged into my Orion II, and both work. I will doing some checking on mine, but the only thing I had to do was use a reducer plug on the rear.

I would check the 1/4 to 1/8 reducer plug first.

From: ac8ir
Topic: 9488 Message: 9488

I am new to the Orion II (I have had the rig for a couple of months and bought it used).

Everything works extremely well except the noise blanker. It doesn't seem to do anything. I have read the manual and searched the net for any info regarding this but I haven't anything as of yet.

Anyone have any ideas?

It is a stock rig with 3.026 firmware.

Thanks in advance

Mike AC8IR

Mike,

Open the bandwidth and use a little wider roofing filter. You will see an improvement. You may also want to try some DSP noise reduction as well.

It should help as you vary the noise blanker settings. You may get the best results with the hardware blanker. You can work the two blankers together, and try to find a low distortion setting.

Hi Mike,

I too bought a used Orion II but I bought mine several years ago. I love it! I suspect you are using the digital noise blanker. Use the one in the receiver menu. It is a hardware noise blanker and much more effective than the digital blanker.

Good luck with your Orion II. I know you will like it. I often use mine on PSK31, crank in the 300 HZ. roofing filter and then bring the bandwidth down and rarely miss a letter of print.

9492. Anybody using the keying loop with Acom 2000A?

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-22 11:55:38 UTC
From: Barry N1EU
Topic: 9492 Message: 9492

I'm using a 565 and a 566 with Acom 2000A amplifer. Several months ago, I started having issues with receive not coming back after a xmsn when using the Keying Loop (TX OUT/TX EN). As a result, I switched to just using AMP KEY between the Orion and 2000A. Previous to this issue arising, I had been using the Keying Loop for 8 years without incident.

My Keying Loop problem is either in the 2000A or in the v3 firmware. To rule out a firmware issue, I'd appreciate hearing whether other v3 565/566 users out there are successfully using the Keying Loop with an Acom 2000A.

No need going into the menu. Just hold the NB button for several seconds, and the hardware version will appear. Likewise hold it again, and it will toggle back to the software NB.

Just like the SAF, you can toggle back and forth from notch to SAF by holding the button several seconds.

GREAT! :-(Right in the middle of a PSK31 QSO, my Orion II receiver went on the FRITZ again! This time, I seemed to lose the receiver. I get white noise from the speaker and volume control works fine but no signals. The crazy thing is I can still see stations on with the sweep scope. At least that will eliminate a bunch of areas to look at.

Anyone else ever have this problem? Hopefully save me some time trouble shooting the receiver section.

Low cut works like the manual indicates. The Hi cut only changes the BW, just like the BW/PBT knob.

Not sure if one of the firmware upgrades changed the way it work, or in this case does not work as per the manual.

So to clarify my comments the BW and PBT work. The LO Cut works, but the HI Cut only changes the BW. NO different than adjusting the regular BW.

I'm using the latest for the Orion II.

I just reread John Henry's comments dated 2012 on the following site.

http://www.tentecwiki.org/doku.php?id=565hilowcut

It seems the Hi cut works just like the BW so I see no need to select it.

Jerry, ki4ps

In the last week I have been having a problem with my Orion I
When I press the power switch the Orion goes into reset mode
Ver 3.032 firmware. I turn the Orion off and press the power switch
on agn and the radio boots up but the Volume control doesn't
work. If I tap on it it will come to life. all other encoders are fine

Sounds like you need a new memory batter. I had the same issue until I changed the memory battery.

Tnx,

Bill, K5LN

9502. Orion 565 TX audio dropping out

Yahoo group: orion565 (2009 — 2013)
Date: 2013-05-28 01:21:32 UTC
From: hummerham
Topic: 9502 Message: 9502

I am having a problem with my 565 TX audio dropping out in mid sentence. I can be talking along and all of a sudden there is no modulation. I can unkey and key up a couple of times and it comes right back. I can also put a CW tone on and it transmits it at full power during the 'audio drop out'. I have changed mics and it still does the same thing. Has anyone had this experience, or does anyone have any ideas ?? Thanks in advance for any help.

73,
Butch...K3AFR

9503. Re: Orion 565 TX audio dropping out

From: Mike Thornton
Topic: 9502 Message: 9503

I had a similar problem. I run my mic through a TT 715 RF Speech Processor and then into my 565. My audio was dropping out and I found that unplugging and re-plugging the audio cable from the back of the 715 into the 565 would clear it up. I think standard audio plugs just need to be re-set from time to time. They seem to develop a film or something on them. This may not be your exact issue, but check all of your audio plugs/jacks.

weird challenge...

Couple of questions / idea's you might want to investigate:

1) Are you using any external (audio) related devices? Such as sound card connection for WSPR, RTTY etc. mode?

2) How is the audio setting for mic? Is it set to both, aux or mic?

3) Do you have any remote control software connected through serial connection and if so, which program is used?

4) Does the problem still occur if you disconnect all possible cables except power, antenna and mice (of course)?

5) how often does this happen?

6) in case it happens every 30 seconds (or shorter) could you use the long voice memory (send 3?) and confirm you can make a perfect recording for longer period? And if so, when playing the voice memory does the sound continue as expected?

7) if you enable monitor and observe your own voice does the interrupt also come through the monitor?

8) if you key through the aux port does the mic sound still brake?

On what could be wrong there are several things coming to mind;

1) leaky capacitor in the mic circuit

2) issue with PTT switch circuit

3) firmware -> did you install the firmware with "ignore stop on error"? Some do and it just works but there is no way to confirm the complete firmware got installed correctly...

In case you have an oscilloscope you could connect the probe to the PTT pin on the mic to trace the dc signal. If there is anything wrong it would show on the scope trace.

Hope this helps and please share your findings.

Best regards, Onno

Date: 2013-05-28 18:52:32 UTC
From: EDEN MCCOLLOUGH
Topic: 9502 Message: 9505

Hello Onno,
Thank you for the questions, suggestions, and ideas.

Firsrt of all, I am running firmware version 3.032. I did do a fresh reload of that firmware, did a Ram Clear, and Master Reset as per TT instructions. The problem still exists.

TX audio source is 'MIC"

The frequency of episodes is random. It will occur perhaps two or three times during an evening QSO of say a couple of hours. Then some evenings it does not do it at all. It lasts only a few seconds or until I unkey and re-key the microphone. So far I have only noticed it on 160 meters.

I do not use any external audio devices, although I did have the serial cable connected to my computer for firmware upgrades and for occasional use with HRD software. I have not had any of that software running during these audio drop out episodes though.

I have as I mentioned, changed mics and still have the problem. I used some deoxit on the mic connectors both on the mic cable and on the radio.

I just now have disconnected the serial cable and will see if that solves the problem. Other than that cable, there are no outside influences on the radio.

I wonder if possibly it could just be a bad or loose connection on the inside of the radio at the back of the mic connector. It is a very intermitant problem and only lasts for a few seconds and so is pretty hard to diagnose. I do not have a O scope. I have noticed that there is no ALC light flash when I am talking during the drop out. I will try the 'monitor' function also now to see if I hear myself during an episode.

I have as mentioned, switched to CW and put out a tone and that is being transmitted.

I will continue to try things and monitor the situation and let the group know what I find....if anything. In the meantime...if anyone has any other suggestions, I would be glad to hear them....

Thanks again to all,
73,
Butch...K3AFR

This will be a tuff issue to crack. With its random behavior you need to be lucky enough to find the root cause.

Indeed enable monitor when it happens while not releasing the mic key... This might give some further indication

Second if you can use the aux mic input on the back (or at least wire it) you can use this as second mic input... When the front mic fails... connect the second mic to back and see if that works.

Third; wire the aux port PTT key pin to control TX. When you notice the signal drop activate the aux port PTT key pin too... See if that gives a different behavior.

Fourth: when you observe the audio drop... activate vox and see if that "fixes" the issue.

Last but not least; make a recording in the long voice memory. And when you notice the issue activate the voice memory... If that activates the rig as expected you know that the internals are working well but something else is broken.

Somehow the issue seems related to the mic circuit and/or the ptt circuit... Several ways to check those with different functions as suggested above.

Good luck and I hope you can find the root cause soon.

Best regards, Onno

Hello all. I've recently purchased the Orion II and really enjoy this fine rig, and have read the manual but I'm unclear as to where/how to active/control is for the squelch. I read it has these on both main and sub recv, but not clear as to where this control is. Otherwise, I'm really enjoying this radio.

Mike: Select Menu, then RX, and scroll down to the main RX sql. There you will see a default of -127 dBm. Move the curser down to it and adjust. You can also set the Sub receiver.

Jerry, thanks for the info....is there a control/knob that can be used to vary this and if not how can you turn this on and off? Is the only way you can have "on and off" is by going thru the menu and adjust till no signal is heard?

The only knob is the Multi Knob. You can find the info in the manual on page 33.

This is not as nice as it is on my Omni VII, but the Orion II is a fine radio. My Eagle is also a great radio.

Good Luck

9511. 3.033 Update question

Yahoo group: orion565 (2009 — 2013)
Date: 2013-06-02 17:13:28 UTC
From: wolobmp
Topic: 9511 Message: 9511

Hello all. Question about the latest update. I have installed this update when powered up stating 3.033 version, coming from 2.98. I have performed a master reset 2 times, and here is my problem.
I have what appears to be no signals present on Sub RX. I had full receive prior to this update.
In the menus: I have Xtal filter: Auto.......Enable 1.8, 600, 300 all set as NO....(I've changed them to yes with no difference). Sub-RX slot 1 at 2.4khz slot 2 at 300hz and slot 3 set at 6khz.
When tuning across the SUB RX a clicking sound is heard as you tune, and an hearing what sound slike static but no signals heard. Also when adjusting PBT I hear what sounds like a clicking sound as well.
The MAIN RX has no issues.
It appears that something is amiss now after this install on the SUB RX only.
Once again a Master Reset was performed and display showed complete.Then asked if the RX366 was installed I stated yes..after which the display went to 14.250Mhz> I also did a Ram clear too.
So all looks like everything installed fine, but the SUB RX is not functioning, and I am thinking there is either a menu setting, toggle, item not enabled, or item that is enabled that shouldn't be.
So, I am at a stand-still at this point in time.
Anyone ?

Thanks in advance for your helping hand,
Mike

This might be a dumb question, but did you install the optional upgraded
RX-366 subreceiver in your Orion or do you have the original subreceiver?

Hello,

I have just purchased the Orion II which has the second recvr already installed. Perhaps when it asked me about the sub rx installed I should of said no.

If you have the RX366 sub receiver installed, then you want to answer YES.

If you have the original sub receiver, then you would answer NO.

Hello all...

Update...I did a master reset and this time when asked about the RX366 sub rcvr installed I said NO...and now the sub rcv is full functioning once again.
Thanks to all for the helping hand...

Hello all.....one last comment........
Also I have noticed that when tuning across the SUB RX I still detect sound like a slight increase in noise, hard to describe, but maybe encoder noise or something similar while tuning every revolution of the vfo knob exhibits this sound...just not sure what it is...this is NOT present on the MAIN RX.

Mike

But I am at least now the SUB RX is working.....

Greetings,
I am looking for info or a diagram of the backplane left side
There are 2 white wire numbered 3 and 4 there are 3 [pins for these wires
they are not numbered.
Does anyone have an idea what position they are in on the board ??
tnx de Skip

9520. OmniRig and the Eagle and the Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2013-06-04 16:30:51 UTC
From: John
Topic: 9520 Message: 9520

Hello All,

Have a customer who wants to use OmniRig with his 599/Eagle. There isn't an ini file for it yet. So, I want to help create it for him. (Note, if anyone has already created one, please let me know and we can get it to the customer to use).

I find that there is an Orion .ini file for OmniRig, has anyone used this yet? If so, does it do what you need it to do?

I have never tried OmniRig, but the customer uses it with cwget, cwtype, etc., dxsoft created dxatlas, etc. And says a lot use it.

If the Orion .ini file is valid and works, then I can clone it to create one for the Eagle. But, I need to know if it is good first. Otherwise I could be creating a bad file for the customer to get ticked off with.

Thanks, and 73,
John Henry, KI4JPL
TEN-TEC Engineering
(yep, working through lunch, so much to get done)

9521. 238 tuner anyone?

For others reference, the Orion ini file for OmniRig has been used and works fine. I'll see if an Eagle specific one has been developed and if not, I'll get it done myself.

9526. 6-meter converters?

Yahoo group: orion565 (2009 — 2013)
Date: 2013-06-12 18:07:58 UTC
From: Stan
Topic: 9526 Message: 9526

I am thinking of buying a new radio, maybe an Orion II, and using my current Orion in a dedicated 6-meter setup (and as an HF backup). I built and used a Ten-Tec 1208 converter a few years back, but they are no longer available unless you happen to run across one used. So I am thinking about either a Down East Microwave or an Elecraft 6-meter converter. Has anyone ever used one of them with the Orion? Any observations on performance?

Thanks,

Stan, W4AG

Topic: 9527 Message: 9527

After many years of being a Ten Tec owner and fan, I finally made it to Seveirville for the tour. It was great to put faces with names and see where all of these wonderful rigs come from. Not much but a shirt and a blue tuning knob ring followed me out the door since I already have an O II but it sure is nice to contemplate a new Eagle for the RV.

9528. RE: [orion565] 6-meter converters?

I ran a Down East Microwave 6m transverter with my Orion I. Got about 20W out on 6m for 0.25 mW (-6 dBm) in on 10m. I can confirm the setup works very well for what it is supposed to do.

I hope so, it is sure to be warmly received by the large number of current users. The question will certainly be whether they can do it with profitability. I wouldn't change much except upgrade to superfast processors and upgrade the display and spectrum scope to high resolution and speed.

If so then:
USB Ports first and foremost!!!,
Heavier duty power connector on rear panel,
Faster CPU's

The current user interface is wonderful, don't change that much if at all. Nicer knobs would be pleasant.

I dont get it. Seems most of you want usb ports and such like to control an analog orion...suprised there is no desire to have an I/Q output at the back of this new orion to connect to that soundblaster card to have a fft display.... its like stacking a computer on top of your orion.

Why not dream about direct rf sampling SDR architecture and combine this with the knobs and dials of the orion... than the computer would be inside the rig... self supporting and no external stuff needed.

And since its a computer you can install voice keyers, recording tools, equalizers, contest logging etc inside your dream rig. And as the new generation orion would be direct rf sampling multi band monitoring and recording is piece of cake.

I love the current orion and it does the job more than needed. But peaking at flex does provoke new thoughts in my mind... who will start that small company which build an enclosure with nice dials and buttons to incorporate such SDR system?

Its just a dream by the way ;-). Regards, Onno

I have the Orion II with 3.033XA installed and I love everything about it except I would like to have the option to adjust the S-meter decay time so it's has a slower fall time. But I don't want it to follow the AGC like the prior software versions had. I just want to adjust the meter action by itself so I guess a new menu item? Otherwise 3.033xa is perfect!

I would enjoy a new Orion However the cost would be the main stumbling block and then the
ease of use. It's all well and good to talk about ports, flash drive input, FFT Spectrums etc.
Who is going to buy a radio that they need a steep learning curve to use it. I think that is what
the Flex people have found.
My idea is keep it simple and clean. Most radio's today have a more button, knobs and switches'
that take away from the ease of use.
Keep it simple and have an output/input device that plugs into the radio for those who want to play.
After the person learns how to use the radio as is, then sell an attachment to further enhance the capability
of the unit.
The attachment could have a FFT or LCD screen with a keypad. This would allow entry into the SDR also
a flash drive port for input of contesting software and station control.
The basic radio would have filters, DSP, Voice Keyer(DVK), user memories for macros etc. Once you have mastered
that, then add the other option to open up the architecture for the programmer.

That way you would have only one unit Orion III and not need a computer attached. The price point then maybe
manageable by more hams.

Skip makes a great point. I have and have had many of the Ten Tec rigs over the years now the O II, VIplus, Paragon. I find myself operating the VIplus quite often (work mostly CW). You well may be able to demonstrate that the O II is a much more advanced radio from a technical aspect than the VIplus. From a user friendly aspect I just love the VIplus and to my ear the noise reduction is much more effective. I would love to have the VIplus with the O II display. One the other side of the coin, I like to operate in the AM mode from time to time and adjusted properly the O II driving my Ameritron ALS 1300 makes for some great sounding AM. DAN, K3XR

Subject: [orion565] re: new orion III

I would enjoy a new Orion However the cost would be the main stumbling block
and then the
ease of use. It's all well and good to talk about ports, flash drive
input, FFT Spectrums etc.
Who is going to buy a radio that they need a steep learning curve to use it.
I think that is what
the Flex people have found.
My idea is keep it simple and clean. Most radio's today have a more button,
knobs and switches'
that take away from the ease of use.
Keep it simple and have an output/input device that plugs into the radio for
those who want to play.
After the person learns how to use the radio as is, then sell an attachment
to further enhance the capability
of the unit.
The attachment could have a FFT or LCD screen with a keypad. This would
allow entry into the SDR also
a flash drive port for input of contesting software and station control.
The basic radio would have filters, DSP, Voice Keyer(DVK), user memories for
macros etc. Once you have mastered
that, then add the other option to open up the architecture for the
programmer.

That way you would have only one unit Orion III and not need a computer
attached. The price point then maybe
manageable by more hams.

Very good point and indeed what more is needed to practice the basis of our great hobby? I guess we are getting bored using equipment after a while and start looking for the next gadget to play with . This might be one of the reasons for the subject as raised and its interesting to read whats on the wishlist :-)

For me its a better antenna setup to challenge the orion a bit more as well to ensure daily chats with the other end of the world cause a "whats next to crack" state of mind. I am far away from that status but once achieved I might climb out of my mancave and will go field portable with a $200 qrp kit with end-fed vertical to achieve the same state of mind but this time enjoying the summer sunshine and become less of a nerd to the outside world.

Regards, Onno

Hi Onno,

You can not imagine how much better the receiver in the O2 is until you compare it in contest environments to other radios while using a high gain antenna in a great location.

My station is located at 1000 feet ASL, on a 300 foot high steep hill. My tower is 75 feet tall and holds a 5 element 20 meter monoband yagi with 45 foot boom.

The overload from strong stations and the intermod interference paralyzed my Mark V, even with narrow roofing filters and other mods. The Orion has been superb under all operating conditions, and with selectivity I could only dream about before. It can handle anything that comes thru my narrow beam width, and with better than 30 db F/B, and 50 db F/S, these other signals are greatly attenuated.

My Mark V came from the factory with too much gain in the transmit IF and was poorly adjusted. It was far from clean.

I like to run about 20 watts from the O2 for DXing, to avoid creating a pile up after calling a DX station. With the adjustment of the processor as I have described in the past, 20 watts is more than enough.

Do go for that dream antenna. Your Orion can more than handle it.

73 and Happy DXing,

Mike

We all can get hacked.

But, this morning I got a new one. A guy called the house with a heavy accent and broken English. He told me he was from Microsoft and that they had determined that my computer had a terrible virus and malware and such.

He wasn't selling anything. He wanted to show me the problem by having me start my computer and have him log into it so he could "show me". (And, of course, have access to everything on my computer including passwords and financial data).

I told him that was stupid and he said I was the one that was stupid as he hung up. Pretty snappy comeback....

Start ...FYI...

a few months back...april i think...

a large set of Yahoo accounts with passwords were stolen directly from yahoo...

so advice it to do good password management...change passwords on some irregular basis

doesnt help in all cases but when bulk hacking occurs you might change it before someone decides to use your account...

end...FYI...

I don't contest much these days, but I was very active at several Austin, TX area stations when the Orion I came out. Everyone was excited about the receiver, and a few of us bought them. The N5TW station was a pair of Orions most of the time (his and mine), but as soon as the K3 came out, N5TW's Orion went to the FS list. For technical joyriding, you cannot beat that receiver, but the user interface is TERRIBLE, and that has really held that rig, and the II, back. That and the tendency to crash a few times during a contest - mine was on it's second out-of-warranty control board. Now most folks that would be in the Orion market have K3's, so if there is an Orion III, TT would be better to build it on the OMNI VI user interface IMHO. BTW, my Orion I sold last week ($1800 after shipping if you want to know), and the fellow who bought it (age 71) can't believe how good it sounds, but he is having a bit of trouble adjusting to the UI.

Is the trimmer next to the TMP #(14A) connector for adjusting the sweep center?
I want to get the internal band scope as close as possible to the (0) Center mark as I can but I'm not sure which trimmer is the one used to adjust the sweep centering?
What is the schematic # for the Orion II Bandscope?

I was very much part of the contesting and low band "scene" 5-10 years ago with first the migration to the Orion and then the K3. I was an early adopter and beta tester of both radios, except I kept my Orion and very glad I did. Ten-Tec was slow to respond but eventually they successfully addressed the issues.

IMHO, the user interface was never an issue and was never terrible. In fact, it's clearly better than the K3. The issues were instability (as John mentioned), poor subreceiver (especially for the low banders), and slow firmware evolution (bug fixes). These issues were all eventually and successfully addressed.

Barry,

I agree with you. I bought my Orion II in 2007 and just love it. The only thing I have NEVER been happy about is the "NR" system. It just does not measure up compared to other rigs' NR I have heard. Some people say that none of them work properly but in my opinion that is BS as I have experienced differently. I hope that some day Ten-Tec will make an honest effort to correct that function. Still say it's the best rig I've ever owned.

Tony: You are correct on the OII NR, it has never performed properly, in my opinion, going back to the OI and it's my guess Ten Tec is very aware of this. Not an expert in electronics but have been on the air for over 53 years and have operated any number of rigs going back to Heathkit. On the transmit side they seem to have done a very good job. My take on the receive side it is that just when they were doing a real good job with equipment i.e. Omni VI plus, they went to more computer based rigs which will require some time to perfect.

Have a Jupiter for sale, gray case, green screen 538, no tuner, has the latest firmwear and cw personality upgrade,comes with 705 microphone and power cable with anderson pp's attached. Radio is a 9 on cosmetics, a 10 on operation, never had a bad report. It works very well with a Regal 707 Mic but that is not part of the package. I have upgraded to an Orion I and have to sale to make wife happy. LOL As with all used radios no warranty implied. 850$

From: Tony Sokol
Topic: 9561 Message: 9561

Hi Gang,
I am in the process of mounting the Clifton Labs buffer amp in my Orion II for use with a panadapter. I talked to the factory today and was advised that "mounting the buffer amp inside the Orion is not recommended." I know there are a lot of them out there and as far as I know there have not been any problems. I would think that the longer length of mini coax required to get all the way out of the Orion and to the amp would load down the IF chain with the additional line capacitance. Does anyone have any thoughts on the subject?

Thanks,
Tony - W9JXN

Could this explain the lack of software "fixes" and software "additions" ?

I know I've suffered from a "pop 'n click" issue since the release of Version 3.x and it still hasn't been fixed. Also, I've sent in a list of possible features I'd like added to the next software upgrade but none have been considered... ??

When we purchased our O2's, we were PROMISED regular updates... I sure hope they keep coming, which brings up the fact thatI sure hope Ten*Tec releases the source code into the public domain soon. At least those of us who have some programming experience can experiment deeper into the radio.

My O2 is less than two years old. If I had to do it over again, I would purchase another.

One good thing about TT is they try to stock pile parts so they should be able to support this radio for years to come.

Flex stated at Dayton that the 5000 was being discontinued due to parts availability. However, they said they had enough parts to support future repairs. Time will tell.

On another side, look at Universial Radios web site. Look at all the discontinue radio that are still in use and repairable.

PS: Unlike Yaesu that seems to come out with a new radio every other year.

9571. Orion 565 AM Carrier Problem

Yahoo group: orion565 (2009 — 2013)
Date: 2013-06-30 20:03:52 UTC
From: larry.w9mdx
Topic: 9571 Message: 9571

Hi Group ... I must add too that I am sorry to see TenTec ending the production of the Orion transceiver. It really is (not was) one of the best out there.

I recently picked up an Orion 565AT and it is beautiful. It works perfectly in every mode and function except one. After you switch to AM and go into transmit the radio goes through it's routine to set the carrier level to 25 watts. Mine sets itself to between 3 and 5 watts instead of 25. I received the radio with version 2 firmware and after talking to Paul at TT I loaded version 3.032. Again the radio is flawless, except that it will not reach more than 3 to 5 watts of carrier in AM transmit and darn, I am an AM'er. Power on all other modes is normal.

I disassembled the radio to check that the DSP board version 2 mod was OK (because it's on the DSP board)and it was fine. I checked all connectors and plugs, replaced the lithium battery and carefully put it back together .. same ol'.

The way TT Paul described the way it sets the carrier pretty much points to the DSP board as the problem. This is an early Orion and the DSP board is white in color and has several jumpers on the back side. I take it that it is an early DSP board. I can buy a new one from TT at a huge cost and put it in myself but I am a bit reluctant. I could send it to them for repair but I really don't want to ship it, besides there is about a four week wait.

Has anybody had their Orion act up like this? If so, what did you find? I am looking for information and insight before deciding which path to take and would be grateful for any of your thoughts.

PS: Me and Google and Bing have become good friends over this! Nothing.

You could always cheat and get a 100 watt CB amp to run as an exciter on AM, although I don't know how many "pills" is a hundred watts...:) good luck my friend.

I am currently using a Studio One on my Orion 1, I have a Regal 707 that for some reason the Orion does not like, distorted output. Have tried Ten Tec's settings and others with no luck. What Mic has been found to work well on the Orion other than a Ten Tec 706 or 708. Studio One does not give the bottom end the Regal gave on my Jupiter and I want that. I guess what I am after is Broadcast quality and would like some feed back from fellow Orion users that have succeeded.

Thanks Robert KF5NXP

I bought my O1 used (1 year old then) and it came with the Studio 1.. I could not get to it to sound right for me so for the last 6-7 years I have used a Heil Pro Set Plus 100% on SSB & CW. I don't do a lot of rag chewing, the mic is always the same distance and I consistently get excellent audio reports from DX. It can be a little heavy if worn for hours but not bad but I do not think I would have anything else for me

The Regal 707 works great with Orion. You may need to adjust the small trim pot under the mic jack on the bottom of the Orion to get the mic gain correct. With an eyeglass screwdriver gently turn pot fully counter clockwise then turn clockwise half way so pot is at 12 o clock position or at 50%.
That should do the trick.
Start with Mic H/W gain under the SSB menu to O-db then press the "MIC" button on front panel and set to 50.
This should be a good starting point.

Hi Robert,

For sure frustrating to have an (expensive) mic with studio quality which does not work well. Can you share more details on this observed distortion? There is a difference between distortion and just sounding different.

In general the following common mistakes are made;

1) connecting one of the mic leads to chassis (ground) as well reversed mic polarity. Easy to verify and certainly something recommended.

2) ALC setting and associated mic gain. Most important is to realize the ALC is frequency agnostic within the TX filter bandwidth. If your voice has an dominant audio presence at a very low frequency this will activate ALC -prior- to the words you say. Increasing mic gain results in even quicker ALC activation and lead to distortion when pushed to far. As well frustration the average output power is low.

Bottom line regarding audio presence: figure out your audio presence and ensure ALC will activate on words you pronounce instead of certain sounds which come with your words.

For example; if you know you have dominant low frequency audio presence try reducing this part of audio presence. Negative TX equalizer value can help you with this but also changing the TX bandwidth low frequency cutoff will help. A quick test would be to change the latter from 150Hz to 300Hz and verify if the ALC is responding differently. If so, you are getting closer to understanding your own audio presence :-)

Hope this helps and best regards, Onno

9579. Re: Microphones compatable with Orion 1

Yahoo group: orion565 (2009 — 2013)
Date: 2013-07-14 09:34:21 UTC
From: pa1ap
Topic: 9573 Message: 9579

To share an real life example;

Using a studio one mic which has a frequency response line as flat at our beautiful Dutch landscape...

1) Default setting on Orion 565 initially motivated me to increase the mic gain to 96 as well use the hardware mic gain at 5dB. This activated the ALC but it did not really follow all the words in my sentences. I changed the TX equalizer to -15dB and ALC became more response. However enabling compression killed ALC responsiveness again as well distortion started... weird?... no ...

2) Taking a different route and after factory default I change the TX low Roll-off from 150Hz to 250Hz. Decreased the mic gain to 40, decreased hardware mic gain to 0dB. ALC follows my voice during the sentence very nicely. Enabling compression does not change ALC although it becomes more active all the time, hence I turned down mic gain to 22. A big difference compared to point 1...

3) taking settings from point 2 and playing with TX equalizer I arrived at +3dB for TX equalizer to arrive at "onno's voice".

My take on this is that studio microphones do exactly what they are build for. Combine studio microphone with a frequency agnostic ALC (within the TX bandwidth) and you are up for a surprise.

As far as my knowledge goes the special HAM microphones follow similar principles as point 2 and 3. The flatline (0dB) does not start at 60Hz but somewhere at 200hz and they also have a +4dB preference around 2Khz (according Heil website).

Do not underestimate the low frequency presence and what this means for the ALC and hence your signal.

Best regards, Onno

I was also using the Heil Goldline mic with my O2 with very good results however I heard good things about a Marshal MXL 144 Ribbon Microphone which sells for under $100, comes complete with shock mount, cleaning cloth and storage case (all but the cable). I have been using the MXL 144 with very good results for the last two years.
Check out the "ham" reviews at eHam: http://www.eham.net/reviews/detail/9377.

You will need a separate PTT switch as this is a studio microphone, not normally intended for communications (lol). I also have a Symetrix 528e, W2IHY 8band and EQPlus in the audio chain.

Finally figured out my distortion problem, was using a Heil cable for Yaesu/Ten Tec, problem was that it wasn't wired just as Ten Tec wired their cable that came with the mic, ground and mic wires were switched on the Heil, funny thing though it worked on my Studio one mic the way it came from Heil. Pulled it apart wired it as the Ten Tec was and ran it through the monitor and its up, did have to cut the trim pot back on the bottom of the Orion. Thanks for everyone's suggestions.

Robert, Glad you got things worked out. I found the Regal 707 mic to sound really good on my Orion II.
There is no one mic that is perfect for everybody because everyone's voice is different and some people need sharp DX audio. Others may prefer a Hi-Fi SSB audio. But one thing I found with my Orion Is you can make almost any mic sound good with the right set of adjustments. The regal 707 with give you that wide frequency response you are looking for. I would mention 2 things about the mic that are negatives.
Suffers from plosive breath noise when talking close to mic. I think you must use a large foam windscreen that fits over mic. Which kills the look of the mic?
Suffers from handling noise. Picks up vibrations from desk I suggest a boom arm or placing very soft feet on bottom of mic stand base.

But if you want great audio and don't need the vintage look I think the Heil PR30 makes an Orion sound incredible.

9586. Update problem

Yahoo group: orion565 (2009 — 2013)
Date: 2013-07-16 14:06:15 UTC
From: Stan
Topic: 9586 Message: 9586

I just bought an O2 over the weekend, and I am trying to update the software. I am getting the "Communication with the radio failed" message. The serial port is working fine with N4PY's control software (which of course is turned off when trying to update) and is set for 57600,8,N,1,no flow control. So, the radio and computer are successfully interfacing thru N4PY's software, but for some reason are not communicating directly. Any ideas?

Thanks,

Stan, W4AG

Barry,

Yes, I used the same port as used for the control software.

Stan, W4AG

This might be a dumb question Stan, but you did set the COM port under
Settings-setup to match the com port used in N4PY?

My only inkling then would be the serial port or USB/serial adapter might
somehow be incompatible.

What version software is currently in the O2 you purchased ? Is it 2.6xx or lower ?? You might want to see if another version might load, if so you might get it to load in steps ??

Anything else I can think of has already been asked by others. The only other thing is to triple check to make sure the software is set at 57,600 as the default is much lower and will NOT work. (all from memory, don't beat me up if my memory has a short in it)

Have your tried this with the "error checking" box
within the Ten-Tec load software turned OFF?

Seems like I recall having to do that at one time
to get things to work as they should.

Hope this helps!

The same problem happened to me with my new Orion II. I use a PC with a dual serial card. My Omni IV and the USB connected Eagle have no problem updating.
When I tried to update my Orion II to ver. 3xxx, I received the same error. I also use N4PY software.

My fix was to use my PC laptop with a USB serial adapter. I use the Tripp-Lite Keyspan USA-19HS. Once I used this method, It updated fine.

By the way a local ham had the same problem with his Orion II, using a serial port. Once he used the Tripp-Lite USB serial adapter with his computer it updated fine.

Not sure what the problem is, but that's how I have to update my Orion II.

The version on the O2 now is 3.026. I have tried both 3.029 and 3.033xa with no luck. The same computer and serial port worked fine the last time I upgraded my original Orion. Yes, the serial port on the computer is set for 57,600. I am not aware of any way to change the communication settings in the O2.

Stan,

I'm not sure if this might be your problem, but what version of Windows are you using? I've found that Windows Vista and Windows 7 have have compatibility issues. I always use my Windows XP computer to update all my rigs....and also, slow the port speed down. I run mine at 9600 BPS and never an issue.

My port settings are always: Port Speed = 9600 Bits per second
Data Bits = 8
Parity = None
Stop Bits = 1
Flow Control = None

I hope this helps you out.

73,
Bill/K1FPV

From: Wes Attaway (N5WA)
Topic: 9586 Message: 9598

One time I had a problem updating my Orion even though it had been easily updated many times before. I finally discovered that in reaching blindly behind the Orion I had plugged in a different serial cable that was not even connected to my computer.

9599. Inrad #752 in an Orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2013-07-16 21:22:17 UTC
From: tomwal59
Topic: 9599 Message: 9599

I am thinking of replacing the stock 1.8khz ssb roofing filter in my Orion 565 with an Inrad #752 2.1khz ssb filter. It seems to me as if the 1.8khz is a bit to narrow and maybe the 2.1khz might be a little better. Does any body who did this have any results to share. Was there much of an improvement. Thanks, Tom KJ7CY

9600. RE: [orion565] Update problem

Yahoo group: orion565 (2009 — 2013)
Date: 2013-07-16 21:23:14 UTC
From: Stan
Topic: 9586 Message: 9600

It is now working, after I picked up a Trendnet usb to serial converter at the closest computer store. It is weird that the Orion worked fine with the internal serial port card in the computer, but the Orion 2 will not. Anyway, thanks to everyone for the suggestions. I noticed that the default speed on the converter serial port was 9600, and it updated fine at that speed.

You're not going to see much difference. The vast bulk of filtering is done in DSP. The roofing filter's action is only important for s9+ signals, and even then, it's far more important for cw than ssb due to the inherent spectral broadness of ssb signals.

Besides, there isn't even a setting in the Orion for a 2.1KHz roofing filter.

From what I have read in order to use the 2.1khz filter you select the 1.8khz filter in the menu. Thanks Barry for your advice.

I use the Heil GM-5 with it set to the narrow setting with good results. I have also used a Shure 444 with good results as well. Good luck.

If you do that, you won't activate the roofing filter until dsp selectivity
is 1.8KHz or narrower. Sorry, but this all sounds misguided to me.

I have a few mic's for my Orion
Currently I am using a Heil HM-12.

When I contest I use a Heil Pro Headset set on Narrow

I also tried a D-104, HM-12 Heil and Orion Heil Mic with a W2IHY box
save your money, it's not worth it.

I had the W2IHY 8 band EQ for my AM rig a Viking Valiant, it works well
with that rig.

Hello Robert, Glad to have met you at Ham-Com. As I told you then, I use a TT 709A and it works great with the Orion. It only cost about $69 with an 8 pin mic plug. At one time you could get it from TT as 709 that was with a 4 pin mic plug.
I also used the 709 with a Paragon, Pegasis, and a Yeasu FT950.
All work great with that mic.

There is one option available and thats the static assignment of filter position... this way the choosen slot position will be used independent from dsp bandwidth. Far from ideal but the static option is there ;-). No experience on this side with special ssb filters besides the factory bandwidths...

I did find the 1800Hz filter very small but using the passband adjustments makes a positive difference. I typically set it to 200-300Hz to ensure the conversation spectrum is optimal. Strictly for contest events though...

I find myself using the 2400Hz filter a lot (with a tiny bit of passband for some stations) or just 3Khz depending band conditions.

Best regards, Onno

Date: 2013-07-19 01:42:49 UTC
From: Stan
Topic: 9586 Message: 9610

I just checked the default settings on the new usb/serial
interface I bought, and the handshaking was off. Somehow, it
still worked. But, I will keep this in mind in the future.

Thanks,

Stan, W4AG

From: pa1ap
Topic: 9586 Message: 9611

One myth which needs to be cleared up is the serial port settings. There is no reason to check / change the operating system serialport settings since the update program will do that automatically. Just like 99.9% of all other serial control based programs. Whatever the operating system has set for the serial port will be overwritten by the programs on top of the operating system.

It would be strange / weird if applications cannot control the serial port settings and require the user to change its settings prior to using software... very strange...

No need to worry about serial port settings. Best regards, Onno

9613. Where to buy new LCD

Yahoo group: orion565 (2009 — 2013)
Date: 2013-07-24 18:20:29 UTC
From: ea5zn
Topic: 9613 Message: 9613

Hello greetings to all, appreciate to know where you can buy a screen for my Orion 565.

I have read PA1AP documents, and according read the reference is: NHD-320240WG-ATMI-NZ

My current screen works fine, but I would like to have a new blue parts.

Grateful for your attention, and responses.

73, Salva, ea5zn.

There are some newhaven displays on ebay. I think they are the same size although there are some differences.
You would have to compare the specs.
search for NHD-320240WG-AFFH-TZ#001-C

Salva ... I would start at TenTec. I understand that a new display is about $160 US and is available. The contact information is on their internet web site. 73 -- Larry W9MDX

Does anyone have the part number for the replacement LCD display currently being sold by Ten-Tec?

Hi Salva, Chas -

Just call or e-mail TEN-TEC. They will supply you a complete LCD display replacement which will be the Blue display that will provide you with a blue background and white characters or blue characters and white background.

You do not want to just purchase any display that may be the same size mechanically. There are definite differences in the logic circuits of the LCD display circuitry. And the power requirements can be different.

I know. I did a custom LCD in my Orion that was the result of much discussion between myself and another ham on the other side of the world who is much MUCH smarter than I am. While I have designed mainframe computers and process control systems in years past, I am sorely out of touch with much of today's electronics. However, we accomplished my "radio surgery" via email text and a few photographs. My LCD worked perfectly on the first power up. But trust me; at this time if you need to change your display, get the kit from T-T. It's cheap @ $150 plus shipping.

Onno / PA1AP's excellent information along with that provided by T-T make the T-T replacement kit easy enough if you have excellent mechanical AND electronic skills. More mechanical in the case of this kit but if you are not savvy on the damage you can render in an expensive radio, then send your radio to T-T and have them do it for you, for whatever they charge.

Gene Story / K7TXO

From: kzerofl
Topic: 9618 Message: 9618

Can some one please post the method of adjusting the power read out for the 565 Orion? When I measure 50 watts output from the radio the radio meter says it's 80. Info would be appreciated.

Topic: 9613 Message: 9619

Hello again, thank you all for the answers, and sorry for to answer before, but I've been on vacation a few days.

The best option is to order a new TEN-TEC, while searching the internet if possible purchase indicating PA1AP, with a difference, which is currently sold: VZ-Built-in Negative Voltage, while the original described in is printed article: NZ-Without Negative Voltage.

It is available at: http://www.newhavendisplay.com/nhd320240wgatmivz-p-1218.html

Do not know if it will be possible to make it work properly in the Orion.

Thank you all for your responses to this topic.

73, Salva, EA5ZN.

9620. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-11 16:14:10 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 9620

Enter your vote today! A new poll has been created for the
orion565 group:

If you could purchase a 565 Orion replacement LCD of these 3 types, which would you prefer?

o Blue/White w/same view angle, Kit form, Some soldering needed = $85 estimated USD price excluding shipment.
o Gray/White w/wide angle view, Kit form, Some soldering needed = $105 estimated USD price excluding shipment.
o Two color (any color) display, Wide viewing angle, Kit form, Some soldering needed = $160 estimated USD price excluding shipment.

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13187672

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

I'd really like an amber on black display for my 565, so I voted for the any color display.

Salva,

I ordered one of the new blue screens from Ten-Tec. It is a slightly different model number from the one Ohno bought and it does not have the flicker problem when using a white screen that others have reported. I am very happy with it.

Good luck,

Stan, W4AG

9623. Orion-II, low RF output when first powered on

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-13 16:10:09 UTC
From: NE7X
Topic: 9623 Message: 9623

Tentec Orion-II, serial number: 06C10225

ISSUE:

I noticed when the radio was first powered on and transmit keyed, there was only about 5 watts of RF output. However after about 1 or 2 minutes it had full RF power output. I did not give it much thought. As time went on, months and months, the issue went to 2 minutes, then to 3 minutes, then to 4 minutes, until it became over 15 and sometimes up to 20 minutes. Once it does finally come up to full 100 watts RF output power, its works solid. Power stays up, even during long contest weekends. I have also observed, when the Orion-II is only putting out 5 watt, the RF meter indicates zero, and in FM mode, it puts out about 10 watts.

FIX:

Using a heat gun with a ¼ inch nozzle and some freeze spray coolant I was able to find the issue. When heating and cooling the three small blue color plastic trimmer pots labeled ALC, RF and REF on the A5 board (board under speaker), the problem would come and go, like turning on/off a switch. Using some electronic contact spray cleaner while rotating the pot wipers back-n-forward a ¼ turn, it resolved the issue. Now when using heat and coolant, the transmitter stays 100% 100 watts RF output. Using a dummy load and RF watt meter, I reset the RF output back to 100 watts full scale. NOTE: You can adjust the RF section up to 140 watts output. I decided not to do so in concern the RF outputs may overhead and have a shorter life.

9624. Problems With Setting Power Reading on Panel Meter -- AM Problems

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-13 23:38:44 UTC
From: larry.w9mdx
Topic: 9624 Message: 9624

A while back I posted regarding a problem that I was having with a newly acquired Orion 565 on AM mode. I received no replies. It appears that I have found what caused the problem and many (I mean many) Orion 565's and 566's may have the same problem but it goes undetected because not that many people with an Orion, works AM! It is part of a larger problem however.

The RF output sensor circuit is pretty straightforward using a toroid and some diodes and other parts. It feeds the meter and generally indicates power output and SWR for the transmitter. The built in processor also references this circuit when automatically setting the AM carrier power to 25 watts.

The diodes are in a part of the radio where they can be affected by many things, including static damage from having the antenna connected during a storm etc. I found the readings on my front panel meter to be correct when indicating 100 watts output when checked on a dummy load and a known good external wattmeter, however, way off when reading lower power.

The radio worked well on SSB and CW but when I switched to AM, the radio would produce no more than 3 to 5 watts of carrier. TT service pointed to the very expensive data board as a probable fix and at $625 I could take the chance with no guarantees.

I worked on this for a couple of months and even found a procedure on the TTWiki for setting the "RF""SWR" and "ALC" pots but kept ignoring it. It seemed that the processor must get some indication of rf power output from somewhere but I kept thinking about the 100 watt reading was right on.

One day, I just got a wild hair and connected a dummy load and a known accurate wattmeter to the Orion and started at it. The procedure that I referenced didn't seem to make a lot of sense so I took a common sense approach to it.

I set the PWR/Multi control to 100 and saw 100 watts on the external wattmeter and on the Orion panel meter. No surprise but when I began to reduce the PWR/Multi control the readings below about 80 watts were very far off. Resetting the calibration of that meter with the "RF" control on the board under the speaker inside the Orion was quite interesting. I first set the output to 50 watts on the external wattmeter and then set the control so that the panel meter said 50 watts. Interestingly, the power output readings were very accurate up to 80 watts and as the transmitter power was increased beyond that, the meter kept indicating 80 watts.

Now the cute part. When the Orion was placed into the AM mode and keyed ... the processor set the carrier to 20 watts! That's not far from the 25 watt spec, the way it was supposed to act.

There was an earlier post today regarding problems with the power output indications and cleaning and resetting those same 3 pots. I emailed Thomas and found that his Orion II is now putting out a 10 watt carrier after he readjusted those pots. Not good! There is a documented procedure on the TTWiki but it is vague and not easy to follow and says nothing about the affect of those adjustments on AM operation.

My guess is that many Orion owners will experience totally normal operation of their transceiver but if they tried the AM mode, they would see carrier outputs all over the place, many times making the radio unusable on AM. This may be OK up until you sell the radio to an AM'er!! In my case 3 watts of carrier wasn't enough to drive any amplifier I own to usable power levels and don't underestimate the Orion's AM capabilities. It is very very good.

I have been using mine on AM for the past couple of weeks and it's working great now! Google and Bing have become close friends as a result of this problem but there is no information on the internet about this adjustment. I could have saved many hours of troubleshooting and work had this been well documented. I hope this helps!

Thanks for the post Larry. I agree that the Orion is an exceptionally good AM xcvr. When 10M is open, I frequently work a lot of AM into Europe and western USA. I get uniformly excellent tx audio reports.

I haven't had too much of a problem with RF output but do notice that when I first key the transmitter, it takes a few seconds for the carrier power to ramp up.

I'll add your troubleshooting notes to the TT Wiki.

Date: 2013-08-17 17:35:55 UTC
From: n3xx
Topic: 9629 Message: 9629

For Sale: DB15-TT-OR cable, for connection of Orion and Orion II xcvrs to microHAM USB Interface II, USB Interface III, Digikeyer or Digikeyer II.

The cable is in like new condition. I no longer have the Orion, so don't need the cable now.

New price from microHAM is $70. My price is $35, and shipping is free to USA.

Please send email off list if interested to n3xx@charter.net .

Tnx & 73,
Tim - N3XX

9630. 566 Sub Rcvr Audio

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-19 13:28:35 UTC
From: ki4ps
Topic: 9630 Message: 9630

What is the acceptable level of received audio on the sub receiver when it's not selected?

I keep the sub receiver AF control muted when not in use. If I turn up the volume, and there is a signal on the sub receiver frequency I hear it. It's not loud as if you select the sub receiver.

All this is on the same antenna.

If I move the sub frequency to the RX antenna only I still hear the signal.

Jerry,

On my O2, when I have the "audio" control set to just "main" for both left and right channels, I only hear the main rx no matter how strong the signal in rx2 happens to be. This works for either a headset or the internal speaker. If I set the "audio" control so that the headset "right" is either "both" or "sub", and the volume is turned all the way down on rx2, I still don't hear anything from rx2 for the strong signal on the sub receiver.

I am using a Yamaha CM500 headset or the internal speaker in my O2. My internal second rx is the stock one, not the new high performance one. I am using firmware in the radio version 3.029.

Hope this helps some.

While we are on the subject, see if this happens to you.

With the MAIN VFO set to one frequency and the SUB set to another frequency, BOTH in the same band (15, 20, 40, 75, etc but not one in 15 and the other in 75) and you have the audio selection set to BOTH, if I increase the volume of the sub it will sooner or later wipe out the main.

In my test just now, I used the 40 meter band and had the Main on ECARS (7.255) and the Sub on Westcars (I think) (7.258). With ECARS coming in really strong, increasing the sub will knock it right out.

That really shouldn't happen. The two should mix.

I'm not sure what Jerry means by "acceptable level". Any level is acceptable if you can hear it.

9633. PRO Audio and the ORION II

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-19 18:34:38 UTC
From: Sam
Topic: 9633 Message: 9633

THIS ASSUMES YOU ARE RUNNING MORE THAN 500 WATTS. The following doesn't not occur at the stock 100 Watt level.

Anyone else running external audio equipment with their Orion II ? I don't know if this applies to the Orion I or not, but feel free to jump in.

I am running the W2IHY 8 Band EQ, Plus the W2IHY EQPlus along with the Symetrix 528e Voice Processor.

I always get super audio reports on all bands except 75 meters, where I'm told there is a noise riding on my audio that is similar to RF, with raspy like hot audio. I have tried everything to eliminate this without any luck so far (work in progress). I should say that I get this problem even without all the audio equipment in line. The radio was back at the factory a few months back for another issue, but was found to be clean when tested for this.

I've tried:
GROUNDING
REMOVING THE GROUNDS
GROUNDING selected pieces.
Using clip on ferrite beads
Moving the coax to different locations
Rerouting the coax
Making all new cords.
Different Mics
Different Antennas
Different Frequencies within the 75 meter band
and others that I can't think of right now.

Anyone else have any problems on 75 meters, or perhaps you are having problems on another band ?

Just comparing notes.
BTW, these problems are NOT present If I connect my ICOM 756pro.

73,
Sam

How about if you remove the audio enhancement equipment and just use a mic to the Orion? I had a problem with the W2IHY 8 Band EQ connected to my Orion when I ran my Alpha 99. Low power, no problem. Alpha on, big problem. It wasn□t just the low bands either. Julius worked with me and thought he had a solution, but after a while I just gave up and asked him for a refund. He was easy to work with, and was still wanting to try other possibilities, but I wasn't willing to go further with it, so I don't blame him. I've had no problems with different microphones, or with my microHam digiKeyer connected to the Orion. That's my experience with an original Orion that has had the microphone input mod put on by the factory.

GROUNDING selected pieces.
Using clip on ferrite beads

Moving the coax to different locations
Rerouting the coax
Making all new cords.
Different Mics
Different Antennas
Different Frequencies within the 75 meter band
and others that I can't think of right now.

Anyone else have any problems on 75 meters, or perhaps you are having problems on another band ?

Just comparing notes.
BTW, these problems are NOT present If I connect my ICOM 756pro.

73,
Sam
K3SAM

Topic: 9630 Message: 9635

I tried your test scenario as you proposed it. The sub will overcome the main when the audio level is set higher on the sub than it is on the main. Just using the bar graph for the audio level reading on each rx. When the sub audio level is set considerably higher than the main, the sub prevails. Even when the sub rx audio level is set 2X higher than the main, I can still hear a little of the main coming through. The two do mix, and the skew to the sub increases proportionately as you would expect. I think this is correct action.

Sounds like rf is getting into your orion. Perhaps the magic hand trick might privode some clue? While transmitting touch the various devices around your orion to see if the rfi changes... if so, you have figure out better decoupling... each wire except your true ground wire should have a good choke. Most logical to detach all optional cables and attach them one by one until the issue occurs or get seriously bad. Also check the mic connection and confirm the mic negative does not connect to chassis... if latter is the case its no good...good luck and I hope you can isolate root cause. Best regards, Onno

9637. Re: [orion565] 566 Sub Rcvr Audio

Yahoo group: orion565 (2009 — 2013)
Date: 2013-08-19 23:14:41 UTC
From: Jerry Rogers
Topic: 9630 Message: 9637

Well I'm trying to follow the last comments. I did find that my sub receivers RF gain was at 100%. I usually keep it at 50%. Even the main stays about 50/60%.

Since I lowered the sub's RF gain the bleed thru is very very low. FYI: If the sub's volume is muted or at minimum, there is no audio from the sub.

On another point, if I'm listening to a signal on the main, then have the sub on the same band where there is no signal, increasing the sub volume up high (sub receiver selected) will cover up the mains signal. A good test to show how noise can cover up a signal.

Anyway, it seems I've fixed my problem by lowering the sub's RF gain.

Hi Sam.

Do you have the microphone mod that is inserted on the mic connector by removing the front panel? I received from TT Gratis. I found that a key that was plugged in contributed to my RFI.

Good luck

Subject: [orion565] PRO Audio and the ORION II

THIS ASSUMES YOU ARE RUNNING MORE THAN 500 WATTS. The following doesn't not occur at the stock 100 Watt level.

Anyone else running external audio equipment with their Orion II ? I don't know if this applies to the Orion I or not, but feel free to jump in.

I am running the W2IHY 8 Band EQ, Plus the W2IHY EQPlus along with the Symetrix 528e Voice Processor.

I always get super audio reports on all bands except 75 meters, where I'm told there is a noise riding on my audio that is similar to RF, with raspy like hot audio. I have tried everything to eliminate this without any luck so far (work in progress). I should say that I get this problem even without all the audio equipment in line. The radio was back at the factory a few months back for another issue, but was found to be clean when tested for this.

I've tried:
GROUNDING
REMOVING THE GROUNDS
GROUNDING selected pieces.
Using clip on ferrite beads
Moving the coax to different locations
Rerouting the coax
Making all new cords.
Different Mics
Different Antennas
Different Frequencies within the 75 meter band

and others that I can't think of right now.

Anyone else have any problems on 75 meters, or perhaps you are having problems on another band ?

Just comparing notes.
BTW, these problems are NOT present If I connect my ICOM 756pro.

Did not know of such a mod Norm. Do you have a TT part number ?
I've had the front panel off three times already to put in a new 10 year lithium battery (lol, 10 year battery that needs replaced every year ?) so I'm sure putting the mod in isn't too much harder than that.

Hi Sam
I don't know the part number.

Remove the front cover and check the lead going from the mic. connector. I think it is #21 . If there is a slight bump " aka ferrite bead" then you already have the mod. If no "bump" Call TT Service and ask for the mod. He asked me to check if I had the mod. So save some time and check before you call.hi hi.

I am now a stock holder in ferrite since I got he ORION. But thats ok..I like the darn thing.

Hope you get it solved

I'm aware of a mic mod on the original Orion, but that was well before the Orion II so should have been incorporated in the OII right from the start, right? Was there another mod for the Orion II also?

It's not a mod, but if you haven't updated the 3 capacitors on your power distribution board (A9) then I would advise it. The stock caps (470 uF @ 35 VDC) will go bad. The board is location right at the bottom.

Another (unapproved by TT) mod is that some owners are removing their speakers and inserting a fan for extra cooling.

I'm aware of a mic mod on the original Orion, but that was well before the Orion II so should have been incorporated in the OII right from the start, right? Was there another mod for the Orion II also?

Hi Stan, I had not read your post, thanks for the info, certainly the best option is to order a new screen to Ten Tec.

Purchased an Orion II, selling one of my Orion 565.
Pristine condition, non-smoking environment.
Radio has 1.8Khz, 500Hz and 250Hz filters. Radio recently returned from Ten Tec for tune up prior to posting for sale. TT replaced memory battery and caps on power distribution board.
Asking $1850 plus shipping.
Postal Money Order, certified bank check or cash only.
Phone: 218-525-6223
Email: rbodine at gmail.com
Tnx es 73

Are the 709A microphones characteristics the same as the older Ten Tec Studio One by Heil? I have a base type voice and too soft, per others on a net I am NCS. I'm using the Orion 2 and have tried various settings of equilization, etc. Any suggestions? Change microphone? Troy, W6HV (don't have that problem on the CW net I am NCS!)

Troy, I am running 709A with my Orion 1 and have good reports. I do not have a deep voice though. I think the TT Studio One was apiece of "crap". Never heard one that sounded good. That is my opinion for what it is worth.

I get good reports with my Studio One mic, using an EQ audio setting in the negative numbers. [I do not have a very deep voice...] One can easily set the EQ for the "best" audio by using the monitor function while adjusting the EQ setting.

Thanks, Jim.With my Studio One settings I have the EQ to the lowest negative number and I have some reports that say it's OK. But, I guess it's very speculative as to what is or isn't good sounding audio. I also tried the W2IHY 8 band equalizer and wasn’t too impressed.

You may want to try a Behringer XM8500 mic. They aren't expensive (compared to mic's tailored to ham radio), and I think you will like the results. They are frequently used in the music industry.

I think you can find them for a price between $20 and $30 on the Internet - maybe even locally.

Hope this helps, Don -

That's why I have held on to my TS-180S... (He, He...).

The Orions should last quite a while, but it may be worthwhile to buy a replacement battery if yours is more than ~ 4 years old.

Perhaps the transvertor output can be used? That would be extreme qrp :-)

Another option would be to use an attenuator pad combined with a TX/RX relais controlled through the amp key option? Set Orion to your minimum power out, calculate the attenuation needed, use a trx relais and you would be officially compliant.

Best regards, Onno

Hello.

I've had the amp a short while and noticed

that in either QSK or Relay switch position, I can hear

a relay when cw mode.

I was under the impression that QSK was a bit

more silent. It's a non issue with the Orion.

Is the norm?

tnx.

My relay in the Orion II always makes noise. I don't there is a way to turn it off in QSK. The QSK in my Argonaut V is totally quiet, so must be diode switching vs. a mechanical relay in the Orion II...

Thanks John.

Clarity is one of many weak points I have.

I was referring to the 420 amp's relay. The front panel

on the Amp has QSK/Relay switch.

I wanted to use the QSK position on the Amp and

felt that it would be as quiet as the QSK on my Orion.

I suppose that being a mechanical vacuum relay, it

has inherent noise.

tnx

Fernando,
Remember that most vacuum relays have a lifetime duty cycle of 1 million operations, which equates to one good qsk contest weekend. I guess that the moral of the story is not to use QSK if it is not absolutely required, or perhaps get an amplifier which uses transistors or fets to do the qsk switching.

Subject: Re: [orion565] Hercules II

Thanks John.

Clarity is one of many weak points I have.

I was referring to the 420 amp's relay. The front panel

on the Amp has QSK/Relay switch.

I wanted to use the QSK position on the Amp and

felt that it would be as quiet as the QSK on my Orion.

I suppose that being a mechanical vacuum relay, it

has inherent noise.

tnx

Does the amplifier relais make more noise when "floating" in the air? Perhaps the relais is firmly attached to the chassis and the chassis becomes the soundboard? If possible you could investigate mounting the relais on rubber patches? There must be more hams facing the same issue and at least one of them would have fixed it :-)

Off topic: Just in case the Orion makes to much qsk noise: for qsk a reed relais is used and it seems some production runs have the reed relais tightly mounted to the pcb. This leads to a soundboard effect. Raising the reed relais by 2mm often solves the issue. Be careful not to raise it to much since it would influence swr on higher frequencies.

TenTec Orion II Problems

I have had the Orion II since it was new in July 2006. It was working well when I last used it but it was not used for a little over two years. Now it will not transmit properly. No auto ATU was fitted and there are no optional filters.

I have removed all cables except 13.8 volt power supply, a power meter and dummy load all of which, including the same cables, worked well with another rig.

On transmit, using either the tune button or CW, all bands showed a high (5:1 or more) SWR and the expected shutdown. On 5W the shutdown did not happen.

I did the “reset to factory settings” that is a master reset as described on page 49 of the manual (version 3 March 2006), but I did not do an internet upgrade. All settings and memories were cleared

After this the external power meter indicated almost 1:1 SWR on all bands, but the internal indication was still a high SWR. This was the same on both ant 1 and ant 2. On 5W output things looked good on the bands above 20 MHz until the power was increased above about 15W. At this point the SWR increased with increasing power as indicated by the internal meter, but the external meter still showed 1:1 SWR.

What do I do now? I have had the top and bottom covers off and there is no indication of distress, no burning, no burnt odour. I did not see a battery, which might need changing by now, although I had a good look for one.

Can anyone help or suggest what should be investigated next? It will be a long way to go if I must return it to TT from England!

Regards

Robert M0BJX

if you havent done it already , i would suggest replacing the internal battery especially since the unit is over 5 years old. the battery is on he front panel and you must remove the frint panel to replace it.

here islink for battery type
http://www.tentecwiki.org/doku.php?id=565battreplace
here is link for getting to the battery
http://www.tentecwiki.org/doku.php?id=565battery

hope this info helps you

Hi Robert,

It might be a long shot but worth trying the following: one of the relais might be dirty / stuck somehow causing poor connectivity. I can share a serial program with you which has a relais on/off sequence as well a function to do the relais on/off with 1 watt output. Both functions can stress the relais contacts a couple of times (10,100,1000,10000 times) and it might help? The program will flip all relais. Windows os is needed for the program.

Best regards, Onno

Hi Robert

You didn't mention (or atleast I didn't see it in your first e-mail) if you have an internal antenna tuner in the rig. And if you do, does it make any difference if it's turned on our not ?

A friend of mine had a problem with the internal antenna tuner on his Orion II when it was new where it wouldn't put out much power. But, I can't remember if the swr was always high as in your case. His problem was all covered by warranty at the time due to it's age.

Dear Onno,
thank you for your interest and kind offer of the use of your relay program.
I have now done the following test with the relays. I selected each band and there was a click as the BPF changed. Some bands use the same filter so it does not change moving from 40m to 30m but it does as I moved down. Moving 80m to 40m to 80m to 30m gave a click each time. I conclude that the BPF selection is working.
I also tested the relays, which are use when changing from Rx to Tx, in the following way. Using 4W of power I transmitted into a dummy load on each band. In every case power was delivered and the Rx / Tx relay was clicking as expected.
I have had a look at the relays, but not had the board out. They seem to be sealed against ingress of dirt. Furthermore there is very little dirt inside the case.
In your opinion, in the light of this new information, and having used the program yourself, do you think it will be of benefit on this occasion?
Thanks once more for your kind offer.
Regards
Robert m0bjx

9674. Orion 565: difference between mic and aux input

Yahoo group: orion565 (2009 — 2013)
Date: 2013-09-07 20:31:59 UTC
From: pa1ap
Topic: 9674 Message: 9674

While cleaning up my radio room I found a couple of interesting components which I quickly connected together. Its a studio mic and behringer voice equalizer system.

The voice equalizer output is at line level and through use of an balanced attenuator I have ensured its output is compatible with the front mic specifications. Audio reports are excellent and this setup seems to be working really well. Clean and crisp.

Since I did not like to have a cable connecting to the front I made another cable (without attenuator) and connected the voice equalizer to the line in of the aux port. Level is compatible with the aux port. Now the weird thing is that the sound is distorted and I do not understand why..... There is a weird echo / vibration in the sound. Almost like it resonates or some sort of sound cancellation takes place.

I have tried the following;

1) included decoupling capacitor (40nF) which made no difference...
2) connected the Orion to dummload and set output power to 5 Watts or so (to exclude potential RFI leaks)... no difference...
3) reversed the mix polarity... no difference...
4) recording to voice memory also captured the weird vibration.

I ensured;

1) correct source was selected (mic or aux and NOT both)
2) while testing the aux connection there was no mic connected to the front.
3) the audio level was compatible with Orion inputs

Anyone who connected a similar system configuration to the orion? What are the things to look for?

Appreciate advice very much. Best regards, Onno de pa1ap

Hi Onno,

How are you monitoring this? It seems to me that it could be that you are hearing the accumulation of digital delays. The Orion itself introduces some delay, and if the processor is digital, it can introduce its own delays as well. If this is the case, the only way to know for sure how it sounds is to record it from an independent receiver and then evaluate the recording. It might actually sound great, but the delay is throwing you off. Just a thought. 73, Mike, NM7X

Onno, I use the AUX input 100% of the time on ssb. I feed it with my Behringer mixer output through an isolation transformer. I highly encourage you to insert an isolation xfmr into the line - I recommend Bourns LM-NP-1001-B1L that is very inexpensive and performs quite well.

2) connected the Orion to dummload and set output power to 5 Watts or so (to exclude potential RFI leaks)... no difference...
3) reversed the mix polarity... no difference...
4) recording to voice memory also captured the weird vibration.

I ensured;

1) correct source was selected (mic or aux and NOT both)
2) while testing the aux connection there was no mic connected to the front.
3) the audio level was compatible with Orion inputs

Anyone who connected a similar system configuration to the orion? What are the things to look for?

Appreciate advice very much. Best regards, Onno de pa1ap

Hi Barry,

Makes perfect sense. I will start the search for a transformer :-) Thanks and regards, Onno

Hi Mike,

I used the Orion voice recorder memory to validate / test the audio quality and this captured the weird vibration sound. And an on the air test connection confirmed the vibration was also noticed by the other station and my voice was difficult to copy. The processor is indeed digital and it does add some delay.

The processor has balanced output and this means hot and cold are opposite phases. My take on this (based on Barry's feedback regarding 600:600 transformer) is that I connected the output incorrectly causing some signal cancellation?

Its only guessing right now as I did not connect an oscilloscope to see what really happens to the signal. One thing which is unanswered for me is why this does not happen when connecting to the front mic connection.... I did include a balanced attenuator which might prevent the vibration sound but how that would work is unclear to me...

Best regards, Onno

>
> Hi Onno,
>
> How are you monitoring this? It seems to me that it could be that you are hearing the accumulation of digital delays. The Orion itself introduces some delay, and if the processor is digital, it can introduce its own delays as well. If this is the case, the only way to know for sure how it sounds is to record it from an independent receiver and then evaluate the recording. It might actually sound great, but the delay is throwing you off. Just a thought. 73, Mike, NM7X

> >
> > Since I did not like to have a cable connecting to the front I made another cable (without attenuator) and connected the voice equalizer to the line in of the aux port. Level is compatible with the aux port. Now the weird thing is that the sound is distorted and I do not understand why..... There is a weird echo / vibration in the sound. Almost like it resonates or some sort of sound cancellation takes place.

Hi Again, Onno, The only thing that comes to mind is that maybe you are getting RF into the input. The microphone input is balanced, as is the output of your processor. The Aux input is unbalanced, and that can lead to some issues if your are feeding it from a balanced source. This might explain why it seems to work fine in the mic input but not the aux. Barry's suggestion is definitely one worth pursuing. Some balanced output circuits do not function correctly if they are feeding unbalanced inputs. The transformer just might get the job done for you. Good Luck. 73, Mike, NM7X

Indeed rf leaking into the audio circuit is one to double, double check.. todays local round on 10m a station reported there was a bit of rfi on the audio. With my antenna setup being oversized for 10m this has always been an issue and with the additional components it might have gotten worse than before.

The transformer will help isolating the external audio circuit while making use of full balanced mode. Latter would have high common mode rejection according the articles I found on internet... the transformer will be mounted as close to the orion aux port as possible.

Earth/ ground is very challenging certainly combined with an antenna system which is only 12 feet away from my rig. The antenna field will radiate into my systems. Combine that with a radio room 24 feet above ground it is hard to make a real earth system.

I have good results using a ground radial system in the shack combined with variable inductor / capacitor to tune for highest current to the radials. Wish I could do this different..... next week I will be rewiring the shack earth system. Just to check iuf everything is still wired as it should be. Ferrite will be placed on all cables except for the ground wires. This to ensure resistance to earth is lowest and resistance to other cables is highest. This way rf would be leaking to earth by default... hope that approach makes sense?

I plan to mount 10/15/10 dipole which hopefully reduces rfi feedback as well.

Best regards, Onno

9681. 565 V3.032x5 released on TEN-TEC Website

Yahoo group: orion565 (2009 — 2013)
Date: 2013-09-10 20:04:24 UTC
From: <jhenry@...>
Topic: 9681 Message: 9681

It is ready for download.
Be sure you read the release notes for it, 34 items modified.
It will require the usual Master Reset/RAM Clear sequence.
Some default values have changed due to requests from MANY users, so, read the release notes, and change them back to something else if you prefer.

Let me know if you all find any real interesting items.

This release also addresses an issue Rob Sherwood has been discussing, how impulse noise can load up the AGC on the 565/566.
Now, when impulse noise comes in (e.g. an electric fence), it will not load up the AGC, making it hard to copy just after the noise pulse disappears.
With the previous release, the noise pulse may sound as a quick snap, and then no audio until AGC decay brings back the nominal receive audio.
With the 3.032x5 release, the noise pulse will last longer, could sound like a scratch or crash (which impulse noise will sound like when NB is not turned on), but when the impulse noise goes away, the nominal receive audio is back to the same level it was right before the noise pulse started. If the sound of the impulse noise is objectionable, then the Noise Blanker will remove it anyway. That is what the Noise Blanker was intended for, to remove spurious impulse noise.

If you find anything that needs attention, let me know.
I want to thank the beta team and developers for spending the last several months hashing through this, I couldn't have made this release without their help and support and holding my coals to the fire.

The release is located at the TEN-TEC Transceiver Downloads web page, along with the version history if you want to peruse it before downloading.
Transceiver Download direct link:
http://www.tentec.com/pages/Transceiver-Downloads.html
scroll down to 565, find "Firmware Ver 3.032x5" on the right hand column, click to download the installer, then run it, look for a new "Start" "TEN-TEC...etc.
The revision notes are at the same location, middle column, or, I've added the link here:
https://www.tentec.com/content/downloads/firmware/Orion%20V3%20History.pdf

Thanks, and 73,
John Henry, KI4JPL

Hi Jim,

This update is only for the 565.
At the moment, we have shifted to a 588 update that may take a bit of time to sort through, so, it will be a while before I get to doing another 566 or 599 or 539 update. So I can't promise any dates at the moment, but it will happen.

Thanks, and 73,

Has anyone else had any issues with this newest firmware concerning VFO A? With Firmware Ver 3.032x5 my VFO A does not operate correctly, as a matter of fact it barely operates. When I turn the VFO almost 100% of the time it just sits there. Sometimes the last 3 digits will flicker but not change. QSYing via the logbook software is ok and direct entry seems to be fine, not using the VFO

VFO B seems to be ok also

Went back to 3.032 and it's ok. I have installed 3.032x5 two different times with the same results

I think I figured out my fix. I have installed .032x5 and reinstalled .032 twice and both times I had the VFO A issue. This last time I went into the menu and changed my VFO rate from slow to fast and now it works! WHY? I don't know. Now I cannot make it go bad now. I've reloaded .032 and now back to .032x5 and it still works. DON'T KNOW and DON'T CARE.. IT's WORKING!!

Fernando, I'm not sure what V3 is either??

Thanks

John

The Orion tuning encoders tend to get flakey eventually. When my vfoA stops responding, I just need to push hard on it and it comes right back to life.

9696. Re: Orion I

Yahoo group: orion565 (2009 — 2013)
Date: 2013-09-14 13:37:48 UTC
From: Howard Smith
Topic: 2806 Message: 9696

Hi John,

You may want to check out the scan rate that your logbook software is using. Commands via the serial port to change the VFO x frequency will hold off the VFO x updates from the VFO x tuning knob. Serial port queries will not hold off the VFO x updates.

Serial Port activity and other keyboard activities, including the VFO x display updates, share the CPU time, and if the scan rate from the logbook software is too high, it will use more than its share of CPU time.

The scan rate for the logbook software should be about 100mSec (10 updates per second). Faster rates are possible, but at some point, it will become an issue.

Hope this helps...

73..
Howard, WA9AXQ

Thanks Howard. But it did it with and without the logging software running. Reinstalled the last and the newest firmware twice to the same results but after changing the default encoder speed, it started to work fine and even after reinstalling both versions again it still works!! Some type of gremlin I guess but all is good right now

Thanks

73

John

Subject: [orion565] Re: Orion I

Hi John,

You may want to check out the scan rate that your logbook software is using. Commands via the serial port to change the VFO x frequency will hold off the VFO x updates from the VFO x tuning knob. Serial port queries will not hold off the VFO x updates.

Serial Port activity and other keyboard activities, including the VFO x display updates, share the CPU time, and if the scan rate from the logbook software is too high, it will use more than its share of CPU time.

The scan rate for the logbook software should be about 100mSec (10 updates per second). Faster rates are possible, but at some point, it will become an issue.

Hope this helps...

73..
Howard, WA9AXQ

There will be updates for Orion II, Omni VI, and others just be patient!

At the moment, we have shifted to a 588 update that may take a bit of time to sort through, so, it will be a while before I get to doing another 566 or 599 or 539 update. So I can't promise any dates at the moment, but it will happen.

Thanks, and 73,
John Henry, KI4JPL
TEN-TEC Engineering

That is great.

A pdf file called "What is V3" describes

the changes in this release .032x5.

This file comes as part of files that is downloaded

from Ten Tec.

Take care and enjoy.

9703. Orion 565 tx audio using the 712 digital interface

Hi guys. I know this problem has been discussed already and I have searched the msgs to find a solution, but there are soo many threads that it is nearly impossible to follow all of them to any conclusion. So I ask here if there has been a solution for no audio tx from the rear audio I/O jack using the 712 TT interface or the SignaLink. My 712 cable works fine with the Jupiter....but when connected and set up with the Orion all I get is receive, although I can hear the digital tones thru the monitor function when transmitting. But there is no output from the radio. Is anyone else still having this problem. I guess I am a late comer in this respect. Thanks for any info.

Hi Skip:

Assuming your rig to be the Orion (565), go to the FILES section of this group and find the folder labeled "Orion 1 (565) RIT Fix". In that folder you'll find a file called "My RIT fix8.doc".

My rig was plagued by "Multi" encoder issues for a LONG time, while others reported mostly RIT issues. Every fix I read about and tried would work for a short time but the problem always returned.

The intermittent problem is caused by Tin-plated pins and sockets (the Orion II uses Gold) that become unreliable over time when age and use causes a buildup of oxides on the surface of the Tin.

The cure described in the file "My RIT fix8.doc" solved my problem and all controls have been flawless ever since (January 2013).

If you have trouble accessing the file, let me know and I'll send it direct.

Topic: 9703 Message: 9706

usual error is to forget to set in the menu for audio in to be aux input and then remember to set back to mic when operating ssb

see ssb submenu

TX Audio Source allows the radio to have audio input through either the front panel mic jack or via the AUX input on pin 1 of the rear panel AUX I/O connector. The available choices are MIC, AUX or BOTH.

Hi Skip
You say your multi control is behaving strange if there are other strange things occurring as well and if your radio has not a battery change in the last 5,6 to 7 years that could your problem flat CPU batteries can cause very erratic behaviour. I was having problems with strange bhaviour changed the battery all fixed.

Tnx Wayne,
THe First things I did was replace the battery... I didn't think at first that was the problem but it did help
some other problem..
I used some "De OK IT" and that helped... then I used a Qtip with ALNOX the stuff they use for Aluminum
wire on the entrance cable to your house... that worked well..

tnx de Skip K3CC

Greetings to the Orion group -

Does anyone have information about the headphone jack (front panel) failing? I had the Orion (565) on with the headset, and decided to go to the speaker. When I pulled the headphone plug out, the speaker worked fine, but when I re-inserted the plug, the audio level on my headphones was waaaaay... down. Never had this happen before.

Any info on experience with this issue would be appreciated.

Thanks -

73,

Jim, K8OZ

When you took the headphone plug out the plug has grounded itself out.. you will need a new female plug for the radio.

Wonder if this might be a problem related to the jacks used by TT. Have an O II that has a very "touchy" CW front panel jack you need to play around with it to get all three contacts to work. It needs to be plugged in and pulled out slightly to work properly. DAN, K3XR

Hello Jim. I use an external speaker (SP-6). I noticed that mine (565) with the speaker plugged in, my head phones audio was down also. But if I plug the headset into my SP-6 everything is fine. I don't worry about it. I just turn up the volume or plug into my speaker's jack.
I figured if it ain't broke don't fix it!

Jim,

Is there any chance that your headphone plug is not the standard size? (I don't know how this would happen, but had to ask.) Does it fail the same way with another set of headphones? And I'm not sure how a "headphone circuit" issue would cause a poor connection at the plug. It's possible the jack itself has failed in early life – that seems remote, but it could happen.

Hi Jim and All .. My bet is that your headphones are monaural and they have a regular tip/sleeve 1/4 inch jack (two circuit) on the end.

The Orion phone jack is for stereo phones, unless you rewire the plug. It accepts a tip/ring/sleeve 1/4 inch phone jack for the standard stereo plug with three connections. The Orion has two independent audio amplifiers inside to drive the left side and the other the right side. There are several Orion features that use this like BINRX and other manufactures rarely do this.

I'm just guessing but if your headphones have the regular two circuit 1/4 inch jack, you probably shorted out one of the amplifiers and it will have to be replaced to fix the problem.

You can check this by taking your headphones and inserting the plug slowly until you just hear the very low audio. Then insert it all the way and the audio should come up to full level. If so, you did!

There are a bunch of Orion 565's out there that are changing hands and unless you read the manual before inserting your headphones, this might become a very common problem. I sent you a copy of page 10 of the operating manual that describes this jack as a private email. I hope it helps. --Larry W9MDX

yup, stereo only, I remember that from the book.. good luck tom N6AJR

In a message dated 9/19/2013 2:49:12 P.M. Pacific Daylight Time,
yawhoo@... writes:

Hi Jim and All .. My bet is that your headphones are monaural and they have
a regular tip/sleeve 1/4 inch jack (two circuit) on the end.

The Orion phone jack is for stereo phones, unless you rewire the plug. It
accepts a tip/ring/sleeve 1/4 inch phone jack for the standard stereo plug
with three connections. The Orion has two independent audio amplifiers
inside to drive the left side and the other the right side. There are several
Orion features that use this like BINRX and other manufactures rarely do
this.

I'm just guessi ng but if your headphones have the regular two circuit 1/4
inch jack, you probably shorted out one of the amplifiers and it will have
to be replaced to fix the problem.

You can check this by taking your headphones and inserting the plug slowly
until you just hear the very low audio. Then insert it all the way and the
audio should come up to full level. If so, you did!

There are a bunch of Orion 565's out there that are changing hands
and unless you read the manual before inserting your headphones, this might
become a very common problem. I sent you a copy of page 10 of the operating
manual that describes this jack as a private email. I hope it helps.

HI Jim
The head sets used for TT 565/566 must be stereo if your head set is
has a mono plug when you plug them you will cause a short circuit and
you will damage the right head phone amplifier and that will require a
replacment.
Both audio channels are still available from rear panel i/o socket. This
is for your info it may not be what has happened to your 565.

Encoder failure

Dear all,

My orion2 shows a continuous failure at the main encoder. It could be something could be fixed updating the firmware ?

Or the option is ordering a new encoder and pray for a good technician ?

Lets determine first if its a encoder issue;

1- when does the problem occur? Does the encode not follow the turns you make? Is the problem consistent? Are there big gaps when turning the knob a full 360 degree as slow speed?

2- which firmware are you using? To my knowledge we havd not seen firmware causing troubles... but it would be good to know version.

3- does the problem change with temperature?

4- an old and often used trick is to reposition the encoder cables as well the logic board.. some report the connectors make poor contact at times causing the encoders work poorly.. this is captured on the tentec wiki page.

Best regards, Onno

9723. 565 Main RX not Tuning

Yahoo group: orion565 (2009 — 2013)
Date: 2013-09-30 04:34:53 UTC
From: KevinCornwell
Topic: 9723 Message: 9723

I've just updated to the latest x5 firmware, I kept getting the master reset messages on every boot so I changed the internal battery. The batt change fixed the master boot problem. I re-installed the firmware, ram/master sequence multiple times. The main RX will not tune. It's 'stuck' on some unknown frequency. VFO A or B can be set to control it, the display will change numbers, the sweep line will move BUT the sweep graph doesn't change and the frequency actually tuned doesn't change. VFO-A or B will properly change the Sub-RX. No go on the Main. I just tried again and it seems that the RX will change frequency, but in hugh jumps - I have no idea the size of the jumps. I tune perhaps 100khz and then suddenly an audible jump occurs (it shifts away from whatever noise it was on, to - where?) Band Changes do occur, but again, no linear frequency change. Doesn't matter whether it's the remote pod or main knob, or what the tuning speed (or step) is.

Ideas?
Thanks,
Kevin, N6ABW

Kevin just asking, would you happen to have any logging program up and running also?

I have had something similar happen 2 or 3 times due to the updates. I tried the master reboot a few times and no help but I did a PC reboot (Win XP and run DXLAB) and it after the PC reboot it would be ok. BTW I have to disable COMMANDER (DXLabs rig control) module before updating the Orion so I don’t think it’s the logging program exactly

But again, I had to do this to mine at least twice, I had the problems and reloaded older firmware’s and went back to the newest and had to reboot the PC to get the VFO to work

Good luck

John

Hi Kevin,

I'm sorry to hear that you are having problems with the latest Orion update.

I am going to ask a series of questions to help see if I can figure out what has happened..

Are you using any rig control software such as N4PY or Ham Radio Deluxe? If you are, try disconnecting the serial port, and see if that makes any difference.

If you go to the RX Menu, does the VFO-A knob move the highlighted line up and down? And also on the other Menu screens?

If you press and hold the Menu button, the display will show the TenTec logo and the software versions. Can you report the version numbers and the dates shown?

If you press the Audio button, does that show the Audio Menu on the right edge of the screen? Does the VFO A knob work with the Audio Menu on the screen?

Now, try the VFO A knob on the main radio screen and report if it works.

Finally, go to the Other Menu, and change the VFO-A Enc Rate to Fast. Exit the Other Menu, and try the VFO A knob. Does it work now? If it does, then go back to the Other Menu, and change the VFO-A Enc Rate back to Slow. Exit the Other Menu and check for VFO A knob for proper operation.

I noticed that you have done the RAM Clear function followed by a Master Reset. That usually fixes these kinds of problems.

Thanks for your help.

73..

9726. Orion-3 wish-list

Yahoo group: orion565 (2009 — 2013)
Date: 2013-10-01 05:55:16 UTC
From: <vk2im9@...>
Topic: 9726 Message: 9726

Hi all,

I’m not sure if T-T is already working on the replacement for Orion-2 or even considering it. I guess the current O-1/O-2 users will be first in market for the new “Orion-3” (if&when), so the wish-list from us, current Orion users, might be welcomed by T-T…

Here are few things what I can think of to start the list:

- Build-in receiver’s frond-end filters capable handling of 200+W, aka W3NQN or similar and mechanical relays for switching (no semiconductors before filters) – no need for external band-pass filters for multi-transmitter operation.

- 2 receivers + 1 transmitter in one box rather than TRX with extra RX. O3 should be capable of cross band duplex. Full SO2R support – while transmitting on one band to be able to receive on other band. The O-1/2 is able to control two PAs for different bands but the true SO2R capabilities are quite limited. It would be nice to have radio where we just plug head-set, paddle and USB cable and that’s all. No need for all these SO2R switching boxes, external keyers etc.

- Build-in AC110/240V power supply. Orion does not come mobile bracket and most backpacks are simply too small for Orion. Since there is no need for DC12V, then the build-in power supply can be DC48V for decent HF-MOSFET PA.

- Two independent LCD screens for 2 receivers with dedicated tune/gain/rit/band-width control knob for each receiver.

- Better spectrum display (higher resolution/sampling ADC).

Any other suggestions?

If the new "Orion-3" will listen like O-2 and does as above, then I'm selling my kidney on ebay.

My 2 cents contribution,(not being sure it hasn't already been proposed :

- both RX phased locked ,(phasing tunable 0° to 2 Pi)
- much more reliable SW /FM (as an example: scanning all rotary encoders mimicking potentiometers OR (even better IMHO): change design strategy
about this and go back to plain pots again by means of multiple ADC)
- CW side tone level control (by Multi "pot") INDEPENDENT of AF level control.(it is vy annoying to have to reduce it when tuning up AF under weak
signal cw DXing conditions!

- Also a NO CHANGE wish (or rather a minor one t.b.implemented in a next FM release):
That SAF. This is to me a HUGE feature and made more then often the difference in weak (stereo with Sub RX) detection in CW on 10 Hz BW !! keep it Just reverse the sequence when hitting the Notch button there: BW first and Center frequency second rather than the other way around as today! Why? Because when in hurry , under stress in dxing and/or QRM: CF - probably already set equal to Pitch - has less priority than BW tuning probability! OK?

On Sep 10, 2013, at 4:04 PM, <jhenry@...> wrote:

It is ready for download.

Be sure you read the release notes for it, 34 items modified.

It will require the usual Master Reset/RAM Clear sequence.

Some default values have changed due to requests from MANY users, so, read the release notes, and change them back to something else if you prefer.

Let me know if you all find any real interesting items.

This release also addresses an issue Rob Sherwood has been discussing, how impulse noise can load up the AGC on the 565/566.

Now, when impulse noise comes in (e.g. an electric fence), it will not load up the AGC, making it hard to copy just after the noise pulse disappears.

With the previous release, the noise pulse may sound as a quick snap, and then no audio until AGC decay brings back the nominal receive audio.

With the 3.032x5 release, the noise pulse will last longer, could sound like a scratch or crash (which impulse noise will sound like when NB is not turned on), but when the impulse noise goes away, the nominal receive audio is back to the same level it was right before the noise pulse started. If the sound of the impulse noise is objectionable, then the Noise Blanker will remove it anyway. That is what the Noise Blanker was intended for, to remove spurious impulse noise.

If you find anything that needs attention, let me know.

I want to thank the beta team and developers for spending the last several months hashing through this, I couldn't have made this release without their help and support and holding my coals to the fire.

The release is located at the TEN-TEC Transceiver Downloads web page, along with the version history if you want to peruse it before downloading.

Transceiver Download direct link:

http://www.tentec.com/pages/Transceiver-Downloads.html

scroll down to 565, find "Firmware Ver 3.032x5" on the right hand column, click to download the installer, then run it, look for a new "Start" "TEN-TEC...etc.

The revision notes are at the same location, middle column, or, I've added the link here:

Comes with the following items: auto antenna tuner, RX366 hi end sub receiver which has 2.4kc and 6kc filters installed and main rcvr has all 3 filters installed. Latest version 3.033xa OS, and also will include Ten-Tec #707 desk mic with 707 T8 mic cable and Ten Tec #709 desk mic with custom mic stand and cable. Everything is perfect in as-new condition and reason for selling is to purchase FTDX5000. (Had one, and would like to put one back in the shack). No mods, from non-smoking home. Have all the box's, manuals, and power cables. No trades and no international buyers. CONUS only please. Price is $3000 plus shipping. Accept postal money order, cashiers check or paypal +3.5% fee. No tire kickers, and price is not adjustable. Any questions, please email. Thanks for looking 73

Ron,
I sent you a note just now to your other email address. I have the whole document package for the Orion/Orion-II remote control for the Herc-II.
I used a relay module (Ebay $10 shipped from BY) to convert the active-low (Ground) Orion-II band signal to the active-high (+13.8v) Herc-II signals.
Three diodes are needed to OR the Herc-II band selection for 40/30m, 17/15m & 12/10m.
The relay module needs 5v via a 78L05 from the Herc-II 13.8v. The connectors, pins and components plus relay module is less than $30.
Don't forget to enable the TX qsk loop and the TX band data to ANT-1 or it won't toggle - at least on my O-II it does'nt.

Search for "8CH Channel 5V Relay Module Board Shield Blue for Arduino PIC AVR MCU DSP ARM US (http://www.ebay.com/itm/8CH-Channel-5V-Relay-Module-Board-Shield-Blue-for-Arduino-PIC-AVR-MCU-DSP-ARM-US-/130987573137?pt=LH_DefaultDomain_0&hash=item1e7f77bf91)"

This one is active:
http://www.ebay.com/itm/8CH-Channel-5V-Relay-Module-Board-Shield-Blue-for-Arduino-PIC-AVR-MCU-DSP-ARM-US-/130987573137?pt=LH_DefaultDomain_0&hash=item1e7f77bf91

Have recently acquired an Orion 565 and it's still taking me to school What is the wiring and set-up to use with a Herc II amp? I have the TX Out / TX EN cables configured between the two, as with my Omni 6+. What else is needed? Any changes in menu settings?

Secondly, what is needed to get the Herc II to automatically follow band changes in the Orion?

Thanks/73, Ron K5XK

9738. Orion II 566V3.033xd released

Yahoo group: orion565 (2009 — 2013)
Date: 2013-10-10 19:47:31 UTC
From: <jhenry@...>
Topic: 9738 Message: 9738

I just posted 566V3.033xd firmware update for the Orion II Model 566. Changes include:

Version 3.033xd July 9, 2013
Modified pseudo AGC attack so that it is more resistant to loading upon impulse noise

You can find it at the downloads section of our website.
Go to
http://www.tentec.com/ http://www.tentec.com/

Cursor over "Downloads" (towards the right)
When you see the selection list pop up, left mouse click on "Transceiver Downloads"
Scroll down until you see the 566 section.
The update installer is on the right column of the screen, and the revision history is towards the top of the 566 section in the middle column on the screen.

This change will help maintain constant receiver level through impulse noise. It helps the Noise Reduction algorithm behave better as well since it now receives audio without the "loading agc" effect it previously had.

Care should be taken to not engage DSP functions that aren't necessary though. e.g. if you really don't have any impulse noise or electrical fence noise, then don't engage the NB, either DSP NB or HW NB. etc.

Thanks, and 73,
John Henry, KI4JPL

Just installed and it works great!

Just a reminder to all after you install you need to do a RAM Clear, Master Reset and Re-Calibrate your S-meter again.
Then go through all of the menus and enable all of your installed filters.

Thank you John "You Are The Man"!

I think that's the date of when the new software went into the beta test stage not the release date?

I'm just so thankful that Ten-Tec keeps making my Orion II better and better!

Thank you again Ten Tec & John Henry for all the hard work you do.

Hi John,

That was the build date.
It was first sent to receiver performance experts for their inputs, then to the beta team, then I held onto it while I was tracking down a problem that I thought was in the code, but turned out to be something else.
You are using the right firmware. It just took a while to go through all those steps above before I felt comfortable releasing it to the world.

Thanks for your interest, and 73,
John Henry, KI4JPL

9747. STEPS FOR AN EASY SOFTWARE UPDATE for your Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2013-10-11 16:52:26 UTC
From: <kc2qma@...>
Topic: 9747 Message: 9747

STEPS FOR AN EASY SOFTWARE UPDATE

Updating the firmware on your Orion II is easy when you follow these basic steps.

First thing I recommend is to go through all of the menus and write down all of your personal settings because these will be reset to factory default's during the update procedure. You could also take photos of the various screens.

Now let's get the latest software for our Orion II from the Ten-Tec Website.
https://www.tentec.com/content/downloads/manuals/566/566-Setup-3.033xd.exe
https://www.tentec.com/content/downloads/manuals/566/566-Setup-3.033xd.exe

Here are the instructions on how to run the update program.
https://www.tentec.com/content/downloads/manuals/566/HowTo.txt
https://www.tentec.com/content/downloads/manuals/566/HowTo.txt

Now let's do the Master rest & Memory clear. Always do the Ram Clear First!

RAM CLEAR: With Orion II power off press and hold the VFO B LCK button while turning on the Orion II power switch. You will see a message "Master Reset Complete". Then you will see a message "RX366 Installed?" If you have an RX-366 sub receiver installed press YES if not press No.

MASTER RESET: With Orion II power off Press and hold the MAIN RX/TX button below the TT logo while turning on the Orion II power switch. You will see again the message "Master Reset Complete".

Then you will see "Clear User Memories" select yes by pressing the AN button.

Now you will see the message "Reset Optional Filters" select Yes by pressing the AN button.

You will again see the message "RX366 Installed" select yes by pressing the AN button.

Once the Orion II boots up completely you should see 14.250 on the frequency display.

To verify that the Orion II ready for use power off the Orion II and then power ON.

OK almost done. Now we need to Re Calibrate the S-Meter and get all of our menu settings back the way we want them.
S-METER CALIBRATION: Here is a link to the calibration procedure.
https://www.tentec.com/content/downloads/manuals/566/S-Meter%20565%20566%20Calibration%20Procedure.pdf https://www.tentec.com/content/downloads/manuals/566/S-Meter%20565%20566%20Calibration%20Procedure.pdf

Now remember when I said to copy all of your menu settings in the beginning now is when we will refer back to them.

Let's start with enabling the filters by pressing "Menus" then "Filter". This will vary for each user depending on what filters you have installed in your Orion.

Now go though each of the menus and set everything back to the way they were before the firmware update.

Here are some quick links to the Ten Tec Website:

The RX-366 is an add on Super Sub Receiver board that you buy from Ten-Tec. So if you did not install one then just answer NO during the firmware update.

Here is a link to the RX-366: http://www.tentec.com/products/-Orion%7B47%7DOrion-II-High-Performance--ASR-Sub%252dReceiver-Board-Kit.html http://www.tentec.com/products/-Orion%7B47%7DOrion-II-High-Performance--ASR-Sub%252dReceiver-Board-Kit.html

I just got nice ORION II. Have a question.
I have recorded voice and cw messages but when I turn the radio OFF and then ON the CW msg.are retained however VOICE msg. are erased. Is this normal?
Thanks, Mark

Hi Mark

Not all the buffers retain the memory when you shut the radio off.. I don't have the manual in front of me, but I think the first 3 save the message and the 4th one loses the info upon turning off the rig.

I only have 3 places for voice messages (Send 1, Send 2 and Send 3) and the first two always stay, the 3rd gets lost when I change bands or turn the radio off.

It would be nice if you could use those memory locations to record "off the air" OR your local voice ID, users choice.

No, AGC works fine after the update. Bear in mind that the Orion II
s-meter response time stays fast even with slow AGC, so don't be fooled by
the s-meter action into thinking the AGC is always fast.

Thanks Barry: I'm aware of the s-meter functioning.

I will do the update today, but is this update intended to respond to QRN/AGC action like John is talking about on the new beta release for the Omni VII?

Yes, this is basically the same change as was done in the Orion 565 and the OMNI-VII. So far, inputs from all Orion 565 and Orion II 566 users have been all positive. No negative inputs back yet. It is a value change in one of the algorithms, and I can tune it a bit more if needed. Will know more over time as I get more inputs back from all respective users. Could be that the value in the Orion and Orion II isn't the exact value I need in the OMNI-VII.

The user of the OMNI-VII that reported that to you also reported that when he lowered his RF Gain a bit it all seemed to be like he had heard before. I am in direct contact with him and the change in the OMNI-VII. So far, all other OMNI-VII inputs have been the same as the inputs back from the Orion users, all positive.

This is actually a MASSIVE improvement for the rigs. The effect of the AGC loading on QRN was impacting the NR routines as well. AGC was being applied when it shouldn't be, and that data went into NR, well, garbage in = garbage out. This is even coming from people who didn't think they had QRN until they had this release. Meaning, the QRN they were having was so fast and low in magnitude that they didn't hear it until now that the AGC isn't wiping it away, and now NR is working acceptably for them. They leave their NB off, and all is well.
It is my belief that this single QRN loading error is the reason we have had so many varied results with NR over the years.
When we made NR a bit more aggressive, customer A is now happy, but customer B is no longer happy. Make it a bit less aggressive and customer A is no longer happy, but customer B is now happy.
I believe this was due to those who ran NB all of the time versus those who didn't.
So far, inputs from both camps of NB users and non-NB users are that NR is working much better. Both are now saying we may need to take it back to what it was upon first shipment which was a tad more aggressive than it is now, because they can turn it to 9 now and it may or may not take out some of the noise. But the muddy / hollow effect is now gone and there isn't distortion added now with NR on like there use to be.
Now, the NR gets a clean signal, and works on it. Over time. Remember... OVER TIME, it is not an instantaneous noise eliminator. It takes a second or two to slowly wipe that noise level away.
I still go back to the original philosphy though, use RF Gain and BW to narrow down and knock out stuff you don't want to listen to, first, then a bit of PBT. Then for the Orion 1/2 owners, utilize SAF.
THEN, and only THEN would one want to consider using NB or NR to get rid of that which can't be removed. NB for QRN/ignition (pick HW NB first, then SW), and NR for the constant irritating noise. AN for the heterodynes. Manual Notch to remove specific areas, e.g. low freq crap that you could use NR for, well, use Manual Notch instead.

Anyway, back to work,
Thanks, and 73,
John Henry, KI4JPL
TEN-TEC Engineering

The NR on the Orion II is fantastic at this point; especially on CW. For example, if I run my RF Gain at 84 and NR set at level 1 with no signal present, it sounds like the volume control is turned all the way down! Yet, I tune across the band for signals and there they are without ANY back ground noise. The NR processing sounds cleanest on strong CW signals but enabling SAF and narrowing the BW greatly improves the NR clarity on weaker ones.

Granted, I live in a very quiet QTH to begin with and that can't hurt. So YMMV. Still, the Orion II NR runs circles around the NR on my TS-990S...no comparison, at least on CW.

Firmware version 3.025 and 3.030 when downloaded do not work correctly they do not have enough data in them eg. 1 line and 8 lines respectively. Also firmware versions 3.032 and 3.032x5 have problems with the operation of the DSP when in diversity receive mode, with both receivers using DSP audio volume when using headphones drops to a unacceptable level. Can anyone throw some light on this problem.

Cheers Wayne VK4EU

9764. Strange behavior from Orion II

From: <psikes@...>
Topic: 9764 Message: 9764

I had a bad scare after being gone for 3 months! Turned on the O II and no audio from the sub receiver, in fact it was reporting that there was not even a sub installed. I did Ram resets and Master Clears until I was blue in the face all to no avail. I called and talked to Paul in service and the only solution was to return it for service. So, my O II went on a vacation to Sevierville (where I had just been!) and went into the queue for repair.

After a lengthy wait I finally got a notice yesterday that they could not duplicate the problem. Not what I wanted to hear after so long in the shop. I am always afraid that glitches like this will recur. Anyway, it should begin its journey home tomorrow and I sure hope it enjoyed this little visit back in the nest. Has anyone else ever had such a thing happen?

I just walked back into the shack to find the display frozen and all the controls inoperative! Rig was just idling on receive but apparently something happened while I stepped out of the shack for a moment. Rig is only a year old so I don't think I can blame 'the battery' yet. I did update to the latest firmware a few days ago. Today's the first I really used the rig extensively...the rig had been on most of the day before acting up.

Anyhoo, I powered it off and back on...so far, so good.

That has happened to me, in my case it was after owning the O2 for about 9-12 months. It was the A-9 distribution board that was at fault. It has happened more than once in my O2 life and each time it was the A-9 board.

Also, my 10 year lithium battery needed replaced within the first two years.

I keep my O2 on 24/7 unless there is a power outage that lasts longer than an hour.

The Orion II froze up again today after being on about an hour. Yesterday, when I turned the radio off and back on, it appeared to be OK.

Today I turned the radio off and back on but now it won't boot past the white TEN-TEC splash screen. Just for grins I reinstalled the 'xd' version firmware successfully...but it still won't boot past the TEN-TEC splash screen display. I attempted a Master Reset but nothing happens when I hold Main Rx/Tx button and turn the radio on. It just displays the initial white TEN-TEC splash screen with no further messages.

I have an email into service@...

Hi John,
While I am not an expert, this sounds like an A9 power supply board problem or a memory backup battery problem(which can cause all sorts of strange symptoms.) Have you replaced the caps on the A9 board yet. See the following link for info:

http://www.n6ie.com/A9_Fix.html

Hope this helps.

Nothing connected to rig. Ten Tec suspects blown caps or a failure on DSP board. They have no replacement boards so will ship off for repair...

They just shipped me another one. It's easy to replace, see the other posts on this subject for the link on how to replace... a lot easier than me attempting to tell you here (plus I go in for a cancer operation in a few hours, trying to cram a weeks worth of stuff in a few hours).

You can fix it yourself by replacing (3) 470uF 50VDC caps... save you time waiting on T*T.

Subject: [orion565] More on frozen Orion II from K7FD

The Orion II froze up again today after being on about an hour. Yesterday, when I turned the radio off and back on, it appeared to be OK.

Today I turned the radio off and back on but now it won't boot past the white TEN-TEC splash screen. Just for grins I reinstalled the 'xd' version firmware successfully...but it still won't boot past the TEN-TEC splash screen display. I attempted a Master Reset but nothing happens when I hold Main Rx/Tx button and turn the radio on. It just displays the initial white TEN-TEC splash screen with no further messages.

I have an email into service@...

I am on my way back home from Radio Shack with 3 new capacitors and a battery.

The three caps on my A9 board look puffy on top, at least compared to the others in there. I will let you know how the repair goes.

Sorry John, at best they'll be a temporary fix, you need the best you can get i.e. high temp low ESR types...

John,
That's a dead give away when the tops are puffy. I replaced mine and the only tough part was getting the solder out of the circuit board holes. Patience and you'll get it.

I pulled three caps from my Orion II. Please take a look at them at the top of my QRZ.COM page for K7FD and give me your opinion. I thought they looked a little puffy or beginning to puff out a bit compared to the other caps I saw on the underside of my Orion II. The one on the far left definitely is looking a little bloated although none of them are as bad as I've seen in some Dell computers..

What do you think? Are these looking like candidates for replacement?

Thanks,

73 John K7FD

John here is a link to the caps in my O1 a couple of years ago http://sdrv.ms/1evrggb the middle cap is very noticeable in the swelling and I replaced them and also shown is the physical difference between the original and replacement caps. I THINK I got mine from TT back on 2009. I replaced mine in July of 2009. Pretty easy job as you know now

I can't tell from your picture but this is what mine looked like. I can't remember if mine was a power on issue or what but the only issue I have today is once I power up the rig, it will not shut off with the on/off switch on the rig. I have to turn the PS off. TT thinks it's a relay on the power board, so I just live with it right now

Barry
Yes the ESR meter approach is valid but I don't believe this is a common test instrument in the average shack.
Given the cost of such a meter I would advocate just buying the caps from Ten-Tec (and keep them in business!)

Along with the power board board caps also pop the front panel and check the caps on the top right hand side - my O-11 has been turned on since 2005 and in 2009 the power board caps did their Chernobyl impression and the CPU board caps were bulging gracefuuly! Along with ESR it is also advisable to get the higher temp caps if possible.

So far in the last 10 years I have fixed big screen tv's, computer monitors and PC main boards of several manufacturers so its not just limited to T-T.
The electrolyte chemicals are expensive and in some cases contain banned substances consequently there's money to be made with counterfeit processes.

From: Jerry Rogers
Topic: 9793 Message: 9793

Has anyone noticed more hiss for the same RF gain setting after the update?
For 80 and 40 meters my RF gain is about 50%.

It seems I'm hearing more. Been playing with the prog. AGC hang-time setting to overcome this.
Again, still checking this out.

Not sure what you mean with hiss.

As John describes the AGC does not activate any more on very short bursts. In other words; if the radio spectrum at your location contains short bursts the previous agc routine would have reduced audio presence a bit more... With the new agc routine those bursts do not activate agc anymore and hence there will be a bit more audio presence depending on agc settings.

I do experience an improved sensitivity for very weak signals. My guess is that I do have short bursts lurking into my radio and previously agc was processing those.

So depending your radio spectrum you might need to adjust the AGC activation level.

My two cents. Hope it helps. Best regards, Onno

Onno: It might just be band conditions over the last several days. The radio works fine, and it seems tohear the weak one very well. I guess what I was trying to say was the AGC (slow) seems to be more active now, and not as subtle.

The radio I compare it against is my Eagle.

Living in the country and not having too use the NB can spoil a person. Any noise here comes from the Atmosphere. So I have a tendency to hear faint noise unless the XLY needs me.

Thanks for your input on the upgrade.

I'm here to tell you that if T*T doesn't have any A-9 boards, then I would HIGHLY ADVISE on purchasing any used Orion, PERIOD.

There is more to fail on those A-9 boards than just capacitors. There as a SMD Chip plus multiple SMD caps / diodes on the reverse, and other parts on the front too.

I also installed the new firmware.
I notice the S meter deflects more.
Tough to see a good peak, needs more dampening now.

BTW, I couldn't understand your last post and had to reread it. It was an error on my part. I haven't had an A-9 shipment from T*T in a few months. What I meant to say was that when my A-9 board(s) would go bad... they just shipped me another one.

The way I wrote it, it just said "They just shipped me another one.", in error.

Like I said, my mind was centered around my cancer operation and it wasn't in the cards. I have to undergo chemo and radiation.

Yesterday, when I turned the radio off and back on, it appeared to be
OK.

>
>Today I turned the radio off and back on but now it won't boot past
the white TEN-TEC splash screen. Just for grins I reinstalled the 'xd' version
firmware successfully...but it still won't boot past the TEN-TEC splash screen
display. I attempted a Master Reset but nothing happens when I hold Main Rx/Tx
button and turn the radio on. It just displays the initial white TEN-TEC splash
screen with no further messages.

John here is a link to the caps in my O1 a couple of years ago http://sdrv.ms/1evrggb the middle cap is very
noticeable in the swelling and I replaced them and also shown is the
physical difference between the original and replacement caps. I THINK I got
mine from TT back on 2009. I replaced mine in July of 2009. Pretty easy job as
you know now

I can’t tell from your picture but this is what mine
looked like. I can’t remember if mine was a power on issue or what but
the only issue I have today is once I power up the rig, it will not shut off
with the on/off switch on the rig. I have to turn the PS off. TT thinks it’s
a relay on the power board, so I just live with it right now

Subject: [orion565] Take a look at these capacitors - do they look like
trouble?

I pulled three caps from my Orion II. Please take a look at them at the top
of my QRZ.COM page for K7FD and give me your opinion. I thought they looked a
little puffy or beginning to puff out a bit compared to the other caps I saw on
the underside of my Orion II. The one on the far left definitely is looking a
little bloated although none of them are as bad as I've seen in some Dell
computers..

What do you think? Are these looking like candidates for replacement?

Thanks,

73 John K7FD

Has anyone noticed more hiss for the same RF gain setting after the update?
For 80 and 40 meters my RF gain is about 50%.

It seems I'm hearing more. Been playing with the prog. AGC hang-time setting to overcome this.
Again, still checking this out.

9804. Orion II with Elecraft P3

Yahoo group: orion565 (2009 — 2013)
Date: 2013-10-20 04:16:37 UTC
From: Tony Sokol
Topic: 9804 Message: 9804

Hi Gang,

There has been some conversation regarding mating the P3 up to the Orion II. I decided to give it a try and am really glad I did. Because the P3 can work with any IF up to around 27Mhz with a simple choice in the setup menu mating it up was a breeze. I actually think that having the large screen on the P3 is much better than trying to cram the display into the limited viewing area being shared with everything else on the Orion's display. If you want a really big display you can get the VGA adapter and go for it! The purpose of my post is to share a short video demonstrating how the display looks in operation. Go here for the video: http://youtu.be/eBUBPBxmZKg . You can also go to my QRZ page (W9JXN) and scroll down to the bottom to see a couple of pictures and the video there. There is also a link to VE7TK's site to get the technical details. I love using this setup especially when the band is quiet or up on the higher bands where everyone is really spread out and may be on the weak side.
Now if someone can come up with an interface to put the frequency data and other functions from the Orion to work with the P3 we'd have it all. Maybe even a simple mixer/buffer to deal with the Omni VII's 70Mhz IF might make an interesting challenge for some astute sole. (Not me!)

Good day my friends and many thanks to the moderater for allowing me to join..
I have a major problem with my Orion.
Here is the run down any suggestions are happily appreciated.

The radio is acting like its squelched up cutting rx while doing this the s-meter jumps up and down when rx cuts meter dispays s5 to s9 needle goes crazy.

Also when I try to use internal atu when tuning the main vfo srarts going down the vand also when keying mic it acts in the same dashion also no audio.

This only starts after about an hour which leads me to assumption that something is get warm or faulty when warm.

My email is m0siy@... if you wish to correspond outside of this page.

Any ideas guys only had radio a week and no I wil not be taking it back it is a thing of beauty and will be repaired. Despite problems I gave found an excellent radio.

Thanks in advance and best 73

This sounds like a faulty A9 board. Replace the caps with higher temp, low esr types and you would exclude that from the equation.

Best regards Onno

From: Chris Pinholster
Topic: 9808 Message: 9808

Orion I for sale $1,575.00 plus shipping from 33786
Comes with DC pwr cable. Remote tuning pod available for an additional $75. No mic.

I am the second owner, the previous owner installed a printed circuit board that he explained had something to do with adding an SDR receiver to it. I never did anything in regards to that and the 565 works flawlessly. Paypal, cashiers check or check that clears before shipping. Located in the Tampabay area.

Barry a few years ago I homebrewed a external encoder for my Omni VI and looked at several encoders and ended up buying one from TT. The others would have worked I'm sure but the pulse per rotation was off by just a bit. I have the schematic of the one TT sent me.. The part number is EC202c128A..don't know who makes it but half the specs are in Japanese and the other half is English

As soon as I can get my scanner to work I'll scan you a copy if you want

Hi Barry,

Actually, not an easy answer.
Always a glitch.

The original Orion started shipping with an Electro Switch 94Q125-02-00606.
They changed the process, got some with real bad results, and then searched for a replacement.
Contacted CUI, and they created one for us, and we ended up eventually with CUI Model EC202C128-2TD-23.75 REV D.

Now, they aren't the same. Different pin out.
The Electro Switch is a "rounded body".
The CUI is a square body.

When you open your rig, you should be able to tell which it is then.
Problem is, there is a different cable for them since they have different pin outs.

Best bet is to check with Paul, and see if he has a replacement, and if he only has one and you have the other, he may be able to send you an encoder and the appropriate cable.

There may be a bit more history with this than I am reporting, only reporting what I'm told.

Sorry, but sometimes things just change.

Thanks, and 73,
John Henry, KI4JPL

One of my Orions has recently developed a problem. After being powered on for a variable length of time (hours), the receive audio starts to have 'artifacts'; then, later, on initiating transmit (either CW or SSB), there is a very very loud 'crack' in the headphones and the radio turns itself off. A few seconds later, it reboots by itself, no human intervention. I called Ten-Tec service, was advised to do a RAM clear and Master reset. Things work ok for a while, but then a day or so later, the problem recurs, most recently while calling VU7AG.

I'm running 1.372, which I've had in it since I got the radio new from Ten-Tec. I like the noise reduction on AM listening.

BTW, the call to Ten-Tec service asking about the power distribution board got the answer that the board wasn't the problem, it was 'firmware.'
The caps on the board look ok physically (no bulging) and I was told there are no replacement boards available for purchase.

FYI, Ten Tec Service is short a technician. I sent my Orion II in almost a month ago...and still waiting. If you need to send it in, they are running a bit behind in shop repairs.

I changed the battery a couple of years ago - the one in there with the problem reads 2.9volts on my DVM - I put a new one in - will see what happens over the next day or two.

BTW, the call to Ten-Tec service asking about the power distribution board got the answer that the board wasn't the problem, it was 'firmware.'
The caps on the board look ok physically (no bulging) and I was told there are no replacement boards available for purchase.

Terry sounds like the power supply plug in the back of the radio. If you pull the plug and look in the connector you will probably see where it’s been arcing, darkened or blackened pins. The female part of the pins starts to spread apart and when you transmit more juice is required and the arcing starts..causing the voltage to be off and causing the reboots..

My favorite story is when I called TT 3-4 years ago about mine, the said “WE HAVE NEVER HEARD OF THIS HAPPENING BEFORE” “WE HAVE BEEN USING THE SAME CONNECTORS FOR 20+ YEARS” ..well long story short, many people had/has called about this and you got a $4k radio with a $.20 piece of plastic. I hard wired a power cord straight to the board..no more issue with that

Good luck

John

I highly recommend you do the following. One of these might solve your issue. If not, they will prevent you from having issues that will pop up. The radio is no spring chicken anymore but it is still a great radio.

1. As others have noted, dump the rear panel DC power connector. Hardwire a pigtail, ideally fused in both positive and negative wires. I did this when my radio started having issues with conductivity through the molex-type pins. My opinion is these pins are barely adequate when they are in good condition for the service load required by this radio. You can also mount a different connector on the radio such as others have done with the Power Pole type. While I use these connectors, I did not feel these were the best long term solution either when "hard" mounted on the panel. I brought 12 gauge wires out through a grommet and put Power Pole connecters on the end of the fused wires.

2. While the radio is opened up, remove the front panel, replace the battery and clean the connector contact-pins. If you do not, that is almost a guarantee you will have intermittent issues with the front panel.

3. If your LCD display is aging, replace it. T-T has a nice replacement kit. I decided I wanted an upgrade rather than a replacement so with some (much) discussion over the Internet with the excellent help of Onno/PA1AP, I tossed the original display and wired in another one that was similar to the blue and white from T-T, except for two major differences: (1) LED backlight instead of TFT and (2) ended the dependancy on the Power Distribution board with a voltage regulator on board the LCD display. Early in the project, I did not recognize that I was not going to need the Pwr Dist board so I also rebuilt it with new high quality capacitors. If I, or some future owner of my Orion 565 wants to re-install the original LCD or a replacement from T-T, my rig is still plug and play for used or new LCD's from or used by T-T. I do recommend the T-T kit; most people with descent mechanical skills can install it easily. My solution could easily render the radio non-operative unless your skill levels of mechanical and small circuit soldering & desoldering, and your eyesight are up to the challenge.

While I was inside my radio doing all of the above, I also built and installed a buffer amplifier I got from CLIFTON LABORATORIES to bring a 9 Mhz tap out the rear panel Spare connector. While this seems like a lot of work to do in one shot while I had the rig opened up, everything worked perfectly the first time I powered up the rig. Actually I did not get around to testing the buffer amp for a few months since I had not acquired an SDR receiver to try it out yet. And then like an idiot, all I had to do for a quick test was to phono jack the Spare connector into the Receive Antenna jack, punch that up on the Sub RX that I dialed into 9 Mhz and bingo, the main receiver from the IF tap was feeding a signal into the Sub Rx.

Still the same great radio with a few improvements that T-T probably would have done if the Orion II had just some minor hardware updates. If I had an onscreen local and GMT clock displays on the LCD and at least one USB port connector on the chassis, I would be really happy. I can't do the clock but I can add a USB port. I will not re-open the radio just for that but if I ever do have a need to get inside again, that and probably an 8 pin mic

connector will be put in.

Will any of the above fix your issue? I cannot say for sure but I think there is a good chance your issue is related to, or being helped by some tired power connector pins. My advise is not to bother to clean and tweak them except as a quick fix. You could use new pins and housings to keep this factory and yes it should get you by for some additional years if the rear chassis fuse socket is also ok.

Indeed poor connector conductivity for the dc powerline is a slow killer. One way to verify is to decrease the voltage to around 12.5 Volt (measured at orion plug). Than transmit with the rig and confirm the screen does not wash out.

If it does you might want to cleanup / modify your power connector. Very quick fix is to connect/ disconnect couple of times and hope the friction would clean enough surface.

Best regards, Onno

Terry,
My 565 had precisely the same trouble as you describe it

~~snip~~

"the receive audio starts to have 'artifacts'; then, later, on initiating transmit (either CW or SSB), there is a very very loud 'crack' in the headphones and the radio turns itself off. A few seconds later, it reboots by itself, no human intervention.
~~snip~~

It was the DC power connector, both jack and plug on back of rig. One side was oxidised looking to the eye. I could see discoloration of plastic on one side of the plug/jack too. I messed with it and failed to repair.

The contact area looked pretty skimpy to me so I soldered in a pig tail with nice old heavy duty male military connector of some sort from my junk box on the end. A matching female went on the end of power cord to mate with it. No more trouble with this issue here.

It may be a power supply problem of some sort. I have and original Orion bought used about 8 years ago. when I have a bad swr on an antenna, and the radio draws too much current, the 25 amp breaker goes. if you have a tentec power supply , the circuit breaker is in the PS, other wise in an aftermarket breaker you should add to the power supply. any how a long slight current overdraw will eventually cause an overheating problem with the radio, like if you are working into a 2:1 sw for a long time. good luck.

This summer, I had a similar problem, and I checked the power connector on the rig - spread the pin on the rig and it seemed good for a few months.
I forgot about that.

I changed the battery yesterday. Still had the problem. Today I replaced the connector on the cable which showed some discoloration on the plastic. Did a ram clear and master reset - three times! The rig did not
work at all - that is, no signals heard on any band on either receiver, and
no RF out the antenna terminal, altho the meter in the rig claimed there was RF and the SWR HIGH warning came on the LCD.

Gave up in disgust. Came back about six hours later - turned on the rig and things seem to be working again.

I had the same problem after the ram clear/ master reset sequence when I called TenTec earlier this week. Wonder what causes that?

Terry, also check the connector on the rig. I replaced it.. kind of a pain but BE CAREFUL.. lots of those little white jumper cables. You have to lay the whole back end over a little to get to the connector and I put it all back and looked good until I transmitted..NO OUTPUT.. come to find out, I pulled the little white cable going in to the PA circuit.. NO POWER OUT..took it all back apart, plug the cable in and been fine since

Good luck

John

From: <objectiveuser@...>
Topic: 9831 Message: 9831

I have noticed that when I turn on the Orion (that has been rebooting) and get 'dead' receivers and high SWR that there is also an apparently related problem.
When the receivers are working, as they are this moment, I get the same amount of signal (and s-meter reading) regardless of which antenna connector I have selected - ANT1, ANT2, or RX ANT. There is no physical antenna on ANT2.

Seems that the antenna selection matrix is having problems. I guess, as Paul of TenTec would say, "everything is driven by the firmware", but it sure makes it hard to troubleshoot things!

Terry N4TZ

It sounds like seasonal issues. Moving from summer to winter often introduces big temperature differences as well increased humidity. Anything mechanical will suffer over time due to those changes. Out of interest what is the environment at your location?

Firmware can be fixed and if you are not using the latest version I would strongly recommend to upgrade. Sticking to old software makes very little sense as many things are significantly improved in new firmware. So if firmware is to blame, upgrading is a much better option than master reset repetitively using old firmware.

Hope you find the root cause!

Regards, Onno

The shack is unheated when not in use - so maybe slightly above freezing in the wintertime, quite warm in summertime.

Terry

Hello,

I do recall a very neat modification of Orion's 12V original power supply socket.
The original socket was replaced with a pair of Anderson 30A poles neatly attached to the radio, not as a pigtail.
Unfortunately, I do not recall who published it.
This mod was published about 2-3 years ago by (I think) a Spanish ham.
If someone can locate this mod, please provide the link.

I recently had a problem with spontaneous reboots of my Orion 565.

Turned out that the power connector is soldered to a board - because of the design there is no mechanical support for the connect. The traces had broken and were not making solid contact.
The other symptom was that when transmitting I could see the display screen dimming.

Mounting a new connector solved the problem.

I think the chassis mounted approach is a good idea. TEN-TEC provides this solution on the Eagle. The pigtail has advantages I think, especially on a larger and heavier radio.

The Anderson connector bodies are made of hard plastic. The original molex-style used by TEN-TEC are made of a softer plastic. The latter has some advantage for side-loading when a cable is unintentionally jerked. An Anderson connector easily comes unplugged but they may also crack with half of the connector bodies hard-mounted. Granted these reasons are a bit of a reach but with a larger and heavier rig like the Orion on a desktop, the chances of damage or disconnect are higher with all of the cables trailing behind the equipment. The other aspect I considered was simply making the connect or disconnect easy on the desktop. The pigtail could be pulled up into view if I wanted to disconnect power quickly; say for approaching lightning storm. I can also reach the pair of fuses I have in the pigtail pair of wires. Depending on your desktop situation, that might be a little harder to do with a rear panel mounted connector.

If I were manufacturing an Orion III, I think the best cost approach would be Andersons and fuse holder(s) mounted on a PCB . When the PCB is bolted up to the rear panel, the Andersons would simply poke through the rear panel and would benefit from the panel providing mechanical support. This would also make shipping a rig easier to package than a pigtail equipped rig. While this is still harder to reach on the desktop than a pigtail, it makes more sense from the manufacturing point of view.

Splitting hairs I suppose. Either method chosen for the existing rigs will provide an immediate improvement over the original connectors that T-T chose for the Orion if yours are already experiencing issues.

Here's my two cents on the s-meter calibration. I'm not 100% sure, but here's my take:

1. Do the simple front panel meter alignment described here: http://www.tentecwiki.org/lib/exe/fetch.php?media=s-meter_565.pdf

2. Apply a 50uV signal to the antenna jack and confirm s9 meter reading. If it's off, adjust the s-meter hardware pot for s9. I'm not exactly sure, but I believe the pot is accessible with the top cover removed through a hole in the top of the front panel near the s-meter. Perhaps someone can confirm this or post a pic of how to access the pot.

(no idea on the power meter calibration)

Tnx fer info -- my situation is that both Power & S are off -- I've just received my O1 back from TT & neither are correct .

I know & hve used the S meter adj from TT -- it doesn't help fer this application .

I think it's the PWR pot & the S meter pot .

9841. Transmit not stopping when PTT is released

Yahoo group: orion565 (2009 — 2013)

From: Rod Greene
Topic: 9841 Message: 9841

I just installed a new to me microKeyer II. Trying to follow the setup instructions in the manual, I connected a mono cable (RCA plugs) between Amp Key 1 on the O2 and PTT IN on the mK2. When the O2 is keyed (via footswitch or VOX) the O2 stays in transmit when the foot switch is released. Only way to get the O2 out of transmit is to turn its power switch off.

Is this controlled by a setting I may have missed? I've read through the manual until I'm blue in the face ... As long as I don't connect this cable between Amp Key 1 and PTT IN everything seems to work okay.

Also - running the rig into a dummy load to eliminate RFI in the shack doesn't make any difference.

For now I'll just not connect this cable. Not sure I need it, but haven't yet tried the mK2 with N1MM or any other software.

9842. The final verdict on my DOA Orion II

Ten Tec service relayed the bad news to me yesterday; failed logic board, a $600+ repair bill including parts and labor. Ouch. My Orion II was purchased new March of 2012, so a bit of a shock. Nonetheless, that's the bad news.

The good news is I worked out a very reasonable trade with Ten Tec on a new Eagle 599AT, NB, and 300hz CW filter...and no out of pocket cost. I won't have the Orion II but I pick up a brand new rig that I have been very anxious to play with. And along with my Kenwood TS-990S, I should be set!

Thanks to all that helped me to try to fix the Orion II. But it wasn't the battery and it wasn't bad caps on the power supply board.

John,

Thanks for the information. Sounds like they don't have any idea what happened to it. Would be good to know in case it's something that can be prevented. But it sounds like you have done everything you could to make the installation safe and sound. I had problems with the capacitors on the A9 (?) board and replacing them fixed my problems. I think you said that you had already tried that - obviously without any success.

Hard to swallow that much in repair cost especially at this time of the year. But you found a solution with the Eagle. I have not heard any bad things about it - all good in fact. Plus you have the new TS-990 which should be an excellent rig. I always loved my TS-950SDX. But I think the Orion II has a better receiver than it did.

Anyway, thanks again for trying to find out the details and relaying the information along.

73 and Happy Holidays!

The word from Ten Tec service regarding logic board failure:

"We have no way of knowing, something external to the Orion. We warranty products for a year against defective materials and workmanship. If the Orion was not assembled properly or had a bad part it would have failed long before now."

So, no definitive answer. FYI, my Orion II was connected to my antenna via an Ameritron RCS-4 remote switch. So are my other rigs and they haven't exhibited any problems. Other than that, the Orion II was connected to my Astron 35 amp PS. So who knows...

The AC power mains are pretty stable here and I don't remember anything strange but we do get the occasional power outage without warning. I have the Astron powered through a a Monster Power HDP 1800 PowerCenter...

...and everything grounded to the hilt with good ventilation all around the rig.

Initially, the Orion II 'froze' once, then twice. The first time the display was frozen as were all controls. One reboot, and it came back to life. Then, a day later while on receive, it froze up again. I rebooted like the day before but the radio would not go past the Ten Tec Logo splash screen. Front panel buttons were unresponsive so could not perform any Master or RAM reset. FWIW, I was successfully using the last available firmware about a week before I began having trouble.

Yes, I replaced both the battery behind the front panel and replaced caps on the A9 board with Ten Tec supplied parts with no luck.

BTW, the TS-990S is awesome, especially on CW. I have mine configured with three controls that virtually eliminate the noise floor. By utilizing NR noise reduction, RX EQ receive equalization, and the BEF Band Elimination Filter I hear nothing but the signals themselves in my Bose AE2 headphones.

But that's for another yahoo group, hi.

I am sorry to hear this. Do you still have the orion2? I have an idea that the clock chip has a bad connection. I had this with mine after replacing the backup battery. The chip beneath the battery did not make solid connection and after replacing the battery I got similar issues as you describe. It might be worth checking if that still possible.

9849. Re: [orion565] Digest Number 2244

Yahoo group: orion565 (2009 — 2013)
Date: 2013-12-14 13:12:04 UTC
From: K7FD
Topic: 9848 Message: 9849

The Orion II is no longer mine, it is at Ten Tec for repair and presumably resale.
I traded it for a Ten Tec Eagle.

73 John K7FD

>
> I am sorry to hear this. Do you still have the orion2? I have an idea that the clock chip has a bad connection. I had this with mine after replacing the backup battery. The chip beneath the battery did not make solid connection and after replacing the battery I got similar issues as you describe. It might be worth checking if that still possible.

Then, a day later while on receive, it froze up again. I rebooted like the day before but the radio would not go past the Ten Tec Logo splash screen. Front panel buttons were unresponsive so could not perform any Master or RAM reset. FWIW, I was successfully using the last available firmware about a week before I began having trouble.

From: Paul A. Ramey
Topic: 9842 Message: 9850

Hello to all,
About 2 months ago I also had a failure of the logic board in my Orion I. I sent it to TT and Paul called me to give me the bad news. We talked about the failure. He said that it was not a common failure but one that does happen.
I was using my radio and turned it off. I came back about 2 hours later and had a broken radio!!!!

So what is a Orion I worth broken? about $0.00. The Orion II was out of production..... So with a new logic board, cap upgrade/replacement on the A9 board and shipping I was into it for about $950.00.
I told Paul to fix it. He called me back to make sure that is what I wanted to do THANKS PAUL!!

I now know that this radio will be in my shack for a long time. It works like a new radio now. The money I spent is still less that a new radio.

Paul, WG0G

I understand your predictament...same with me, between a rock and a hard place. I have no beef with Ten Tec service, but my concern with sinking more money into my Orion II, I would hate to see another repair bill crop up in another year or two on a problem no one seems to know why it happens. And now the Orion II is out of production. So I decided to cut my losses and shift gears to the new Eagle in light of Ten Tec's very reasonable trade-in allowance on my Orion II. This solution worked for me; I sure enjoyed my Orion II but looking forward to the new rig as well.

I appreciate the decisions both of you guys made. No doubt that Ten-Tec
will repair the Orion II and sell it themselves. I guess it boils down to
how motivated you are to keep that particular radio in the shack.

John:

That's bad news, I'm sorry that happened to you. I have an Eagle too, you will like it, but its not an O2.

I bought my O2 new in Feb 2012. Kinda scares me if I got the same production run of logic board. I wonder if I should buy an extra logic board for a spare (while they still have them) so I can put it in myself when mine goes because of an "unexplained external problem"

Dang, with it only being 8 months outside the warrantee, wouldn't they split the cost with you? Done the labor for no charge? Something so that you didn't loose your O2?! In the absence of a clear external causes wouldn't they give you the benefit of the doubt?

I hear all the time what great service TT has. Well, these things I mentioned above are what companies with great service do.

Subject: [orion565] The final verdict on my DOA Orion II

Ten Tec service relayed the bad news to me yesterday; failed logic board, a $600+ repair bill including parts and labor. Ouch. My Orion II was purchased new March of 2012, so a bit of a shock. Nonetheless, that's the bad news.

The good news is I worked out a very reasonable trade with Ten Tec on a new Eagle 599AT, NB, and 300hz CW filter...and no out of pocket cost. I won't have the Orion II but I pick up a brand new rig that I have been very anxious to play with. And along with my Kenwood TS-990S, I should be set!

Thanks to all that helped me to try to fix the Orion II. But it wasn't the battery and it wasn't bad caps on the power supply board.

Well I was hoping for spirit of the season to help, too...but, alas, no cigar, hi.

Nonetheless, the Eagle will fill a spot here in the shack that is more suited to a smaller footprint. My main rig is a TS-990S, so desk space has become scarce...

I had been wondering if I really needed two high-end rigs, so the Eagle had been on my mind. The Orion II repair just sort of forced the issue. And I was happy to have the convenience being able to trade right then and there. I do appreciate the fact that Ten Tec takes trade-in's on their gear and I felt the trade-in allowance offered by Stan and Robert was very reasonable. It saved me time and the hassle of selling, insuring, and shipping.

Still, your point of some level of adjustment on the repair cost is well taken but in my case was not offered by Ten Tec service. When that did not happen, I decided to go for the Eagle.

Ten Tec has been good to me over the years; let's hope they continue to produce great radios!

I had a Sync Board fail within the last 6 months, no explanation from T*T, only that it was not covered under warranty and the new board / install / etc. was well over $600. This will be the LAST high dollar repair I put into my O2. After that it will be the newer Kenwood, Yaesu or possibly the ICOM 7600/7700 series radios.

I NEVER expected T*T to pull the O2 from production this quick.

I don't know why Ten-Tec is not trying to fix the bad logic board? This can be bad component for let's say $10 . Why they just offering new board? They don't have any good technician to troubleshoot on components level?
I have similar problem with Orion 1. The synthesizer board an logic board were bad. I spent $40 for parts to fix it (bad 8v voltage stabilizer , 1 smd capacitor and one more chip (I don't remember the number now but I can find it).
So I strongly recommend to try to fix the board first.
Thanks

I responded to a bench tech job posting TT within the last 2 years. Pay was $10/hr. I did not pursue it any further. I don't know the techs there now, so no disrespect is intended, but this explains allot.

Someone independent setting up shop to repair TT gear might do well. At the rate TT is going, that may be the only option at some point in the future.

Never mind - I now realize you're Alan WA2AC who had a 565 logic board failure a year ago and obviously an unhappy camper.

I have decided to sell my Orion II station. It is in excellent condition with the following: external keypad, LP-Pan system, all internal filters except 300Hz, internal factory tuner, 307B external speaker, original shipping box which is a little rough, manuals. Works great. Also have Centurion for sale in separate ad. You will not be disappointed with this Orion II. It is in excellent, almost mint, condition. Paypal if you pay fees. $3295 plus shipping.

Chris, read back from the beginning of the thread

http://groups.yahoo.com/neo/groups/orion565/conversations/topics/9867

Service info was included in all Ten-Tec transceiver manuals before the
Orion, but not after.

I have re read the thread, my confusion is the original poster asks if the manual is available as a .pdf file. I read that the answer is no, it's not, but I was wanting to know if I could buy a proper paper manual for it. So no service information is available at all from Ten Tec to an end user? Thanks Barry, and all the best for Christmas and the New Year.

Chris, Ten-Tec has never sold a service manual of any form. It may be possible to email or phone Ten-Tec and receive specific Orion service information. (if anybody does receive info, please share it)

Thanks Barry, I have never purchased a Ten Tec product, so wasn't aware the owner couldn't access service information for the Orion. Do owners not find this restrictive? I fear it has put me off the idea of one, I wonder why they took this step with the rig? Do you have access to full schematics?

9876. What SigalLink Cable to Order???

Yahoo group: orion565 (2009 — 2013)
Date: 2013-12-28 00:39:42 UTC
From: <mleary2001@...>

I want to order a SigalLink USB external sound card, but I am not 100% sure what cable I should order. I believe I should get the 4-pin round mic connection, since my Orion 565 has a 4-pin round mic socket.

Am I on the correct path?

Thanks in advance,

Mike K7MSO

No, you're not Mike. You should connect it to the AUX I/O connector on the back (8-pin DIN).
See my homepage for details: http://www.frenning.dk/OZ1PIF_HOMEPAGE/SignaLinkUSB-mods.html
DIY is the way to go here...

Happy New Year and happy tinkering.

9879. Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2013-12-31 23:29:12 UTC
From: n9aop2000
Topic: 645 Message: 9879

Hi Guys,
I am trying to decide whether to keep or sell this radio. I really do like it and it has never given me any trouble. Are the chances good that this rig will continue to perform? Having TenTec willing to repair their products is definitely an asset but if the repair is in the six to eight hundred dollar range than that is an appreciable amount compared to the purchase price of the radio.

Do you think that TenTec really had a parts problem and that is why the O2 was discontinued or do you think that they just chose not to compete in this price class at this time.

I’m trying to thin the fleet some. I have for sale an Orion II 566AT, matching speaker, remote tuning pod and Centurion amp for sale. All for $5000 plus any shipping. Would be great if could pickup in upstate SC. Will be willing to travel up to 150 miles, too. The equipment is in excellent condition and in current, casual use. The amp has been recently upgraded at TenTec with new tubes, QSK board, etc. I will send more details to seriously interested. The amp is a “B” or black model and matches the Orion II.
Thanks and 73 to the group
Dick W4WU

Art, if you like the radio, keep it. That's my $.02 in a nutshell. I'm not a worrywart.

Besides, if you sold the O2 for $3K, what would you buy?
